The genesis of the orebodies is the most important question from an economic standpoint. This, once understood, gives a reliable basis for considerations as to the probable position and arrangement of the orebodies.

The conditions in the portions of the belt on the opposite sides of the Sacramento river are very different and the two areas must be treated separately.

The rhyolite belt west of the Sacramento river, called the Balaklala rhyolite (U. S. G. S. Redding Quadrangle), is formed by a succession of flows, and I do not doubt but that by careful study the various flows might be differentiated in the underground workings. The question is whether the ore deposits are confined to one or more flows, or are distributed through the entire rhyolite mass. The fact that, as yet, no ore deposits have been found in the Copley andesite may be a lead in this direction.

It would also be interesting to have a careful chemical study made of the rhyolite, to determine whether that rock contains a minute quantity of copper, although even microscopically not observable. This was found to be the case in the Encampment district of Wyoming.*

It must further be noted that often, at a relatively considerable distance from the large orebodies, small aggregates of sulphides are found, principally chalcopyrite, associated with secondary silica. Why these small aggregates are so much higher in copper, or, in other words, why in these smaller aggregates pyrite forms a small portion of the sulphide deposit, while in the larger deposits it forms by far the major portion of the sulphides, is another question that demands elucidation. Assuming the generally accepted theory that these ore deposits formed in shear-zones in the rhyolite, it must be observed that the silicification of the rhyolite mentioned by Mr. Campbell is at least, to a certain extent, posterior to the formation of the sulphides. A microscopic examination will show that some of the pyrite crystals are fractured, and silica has been deposited in the fracture planes.

The section given by Mr. Campbell of the Iron Mountain deposits indicates, in my opinion, that the deposits on the north slope of the mountain (Hornet mine) have most probably at one time formed one deposit, which has been subsequently faulted. Some of the other deposits in the same district clearly indicate a similar history. The down-throw of these faults is, as far as determined at present, northerly. This leads me to the suggestion that the movements that caused this faulting were associated with the volcanic disturbances in the Mount Shasta region, and a sinking of the surface in that vicinity at the close of those eruptions. This faulting may reasonably account for the dispositions of the orebodies as found at present (See Fig. 1, 2, and 3), especially if we consider that, before causing faulting, a folding of the strata may have caused the formation of monoclines. If my information is correct, the deposit in the Mammoth mine lies in the form of a saddle and a reconstruction of the Iron Mountain section given by Mr. Campbell would probably give a similar form. (See Fig. 4.)

Up to the present time no intrusives have been ascertained in the Balaklala rhyolite; the copper in the solution must then either have been derived from underlying formations, or have been leached out of the rhyolite, a possibility to which I have already alluded. I incline to the former idea, especially in view of the character of the Bully Hill deposits.

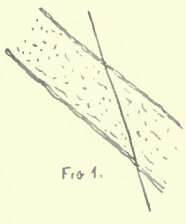

Fig 1.

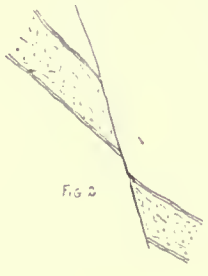

Fig 2

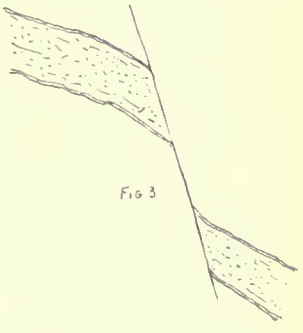

Fig 3

The characteristics of the deposits east of the Sacramento river differ in many particulars from those in the western portion of the Shasta County copper belt.

The ore deposits are situated in a zone of mineralization, which has a northeastern strike and a steep dip.

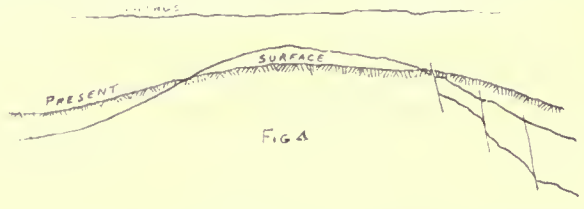

Fig 4

This zone is contained within a body of rhyolite, the Bully Hill rhyolite. This rhyolite forms an I, the Bully Hill and adjoining mines are on its north branch, some copper ore deposits are found in its stem where it crosses the Pit river, and the Afterthought mine is located on its southern branch. In this district the copper deposits are, however, not restricted to the rhyolite. Some are found in the Dekkas andesite. According to Diller, the Dekkas andesite and the Bully Hill rhyolite are Triassic and consequently much younger than the pre-Devonian Copley meta-andesite and the Balaklala rhyolite. In the Bully Hill district there are intrusions of a diabasic rock in the rhyolite. The rhyolite is much more sheared than west of the Sacramento river; the shearing is so intense that in places it has a perfect laminated structure.

Of the three main ore deposits in the vicinity of Bully hill, the Winthrop, the Rising Star, and the Bully Hill, only the last is directly associated with the diabasic in-

*Arthur C. Spencer, U. S. G. S. Prof. Paper No. 25, p. 35.

trusion, which forms the east or hanging wall. This intrusion is not noted on the sheet of the structural geology, as given in the 'Redding Quadrangle' of the U. S Geological Survey. Exposures of similar intrusions are fouud at other places in the area of the Bully Hill rhyolite.

The orebodies are lenticular in form, but their vertical axis is far in excess of their horizontal axis. In the Bully Hill mine, the vein has persisted to a depth of 900 ft. and is still strong at that depth.

There is not only a structural difference between the ore deposits east and west of the Sacramento river, but also a pronounced mineralogical difference. The ores of the Bully Hill district are richer in gold and silver, and a conspicuous percentage of zinc-blende. Their copper content is also much higher, and the secondary enrichment is far more important than west of the Sacramento river and more persistent in depth. The bottom has not yet been reached in the Bully Hill mine.

There is every reason to assume that the ore deposits in both portions of the Shasta County copper belt have been formed during the great post-Jurassic disturbance of the Sierra region. While the data in my possession are not sufficient to state positively that the ore deposits west of the river are restricted to certain flows, or to certain differentiation in the Balaklala rhyolite, there are some indications that the material enclosing those deposits differs from that at a distance from the orebodies, more especially in the classification of the feldspars, which in the latter belong more prominently to the soda-lime series.

The presence of more basic intrusives reaching the surface in the Bully Hill district justifies the hypothesis that here a magmatic differentiation has taken place, that the ascending waters obtained their metallic solutions from the more basic material, and deposited the minerals in fracture-planes of the overlying more silicious portions, the later intrusions of the more basic portions into the overlying strata taking place along the same lines of weakness in those strata.

West of the Sacramento river, no such basic intrusions have as yet been exposed. There is a possibility that similar magmatic differentiation has taken place in depth, and that these underlying basic portions have not been intruded into the overlying more silicious material, but yet have been the source from which the ascending waters have obtained their metallic charges.

It may also be that the hypothesis of a magmatic differentiation is in both cases erroneous, and that the ascending waters obtained their metallic charges from a more deeply seated source. This view is partially confirmed by the fact that the pyrite in the country rock is not an original constituent of the rock.

All these points can only be fully determined by a detailed study. The able mining engineers who conduct the various enterprises in this belt are in position to solve them, and to them we must look for more positive data.

San Francisco, May 8.

Acetylene Lamps.

The Editor:

Sir—I observed in your recent article on Guanajuato a reference to acetylene lamps. Possibly the following may interest you:

At the Newhouse Tunnel we first tried, some six months ago, to substitute acetylene lamps for candles in the headings, with the object of securing better light. We are now using them exclusively, except at points along the main tunnel which can be illuminated by incandescent lamps taking their current from the trolley line.

The lamps we use are of the Wolf pattern, cost $2.25 each, and weigh 2¼ lb. empty, or 4 lb. fully charged. The receptacle for carbide when full holds half a pound, which will burn for from 12 to 14 hours.

The light given depends on the rate of admission of water to the generating chamber, and this can be closely regulated by turning a screw on the outside of the lamp. We have never measured the intensity of the light, but it must be equal to that of at least six candles. In places where candles can only be used enclosed in a can ('bug' or 'go-devil') the acetylene flame needs no shield excepting the reflector behind it.

Carbide costs us 6c. per lb. delivered at Idaho Springs, in ton lots. We find the average expense per lamp per month to be approximately $1, of which 90c. is for carbide and 10c. for repairs. Candles cost about $2 per man per month, excepting in draughty places, around machine drills, etc., when they are excessively wasteful and unsatisfactory, and probably cost more than twice this rate.

All our lamps are stamped with a number, and each man is held responsible for his own lamp. They are cleaned and filled by the enginemen on spare time, and no account is taken of the cost of cleaning and filling, in the estimate of monthly cost. The lamps are left in the power-house by the men to whom they have been allotted, on going off shift, and are ready for use when called for next shift.

We have had no complaint whatever in respect of headaches, even from the men who clean and fill the lamps. This may be due to the altitude; I have noticed that headaches from handling dynamite, etc., are more severe and frequent at lower altitudes. I have tried other types of acetylene lamps elsewhere, and found them troublesome; but can recommend these for use in mines where they can be properly cared for.

GEORGE E. COLLINS.

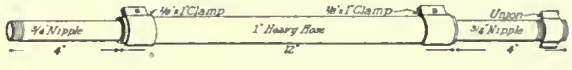
Denver, April 29.

An Idea.

The Editor:

Sir—Some years since I discovered that in mines where machine-drills were used a great deal of labor and air-pipe was lost in turns and sharp bends in drifts, stopes, and in other places in mines where air-pipes had to be placed.

The following device I have used for some time, and have often wondered why no one thought of it before: For ¾-in. pipe, use pieces of 1-in. heavy hose (old air hose will do) 12 in. long, with 4-in. by ¾-in. nipple



screwed into each end of hose and clamped in with clamps, ⅛-in. by 1-in. iron, around the hose at each end. Unions can be attached to one or both nipples for convenience, or not used at all, as desired. If 1-in. pipe, use 1¼-in. hose and 1-in. nipples, and for 2-in. pipe, 2½-in. steam hose can be used to advantage. If the nipples are warmed just before putting into the hose they will be sure to be air-tight. Application has been made for a patent.

W. S. HASKINS.

April 27.

[Such suggestions are most useful. We thank Mr. Haskins cordially.—Editor.]

ADEQUATE ventilation is one of the best preservatives for timber. A steamy atmosphere may rot 12-in. Oregon pine in six or eight weeks. Timber with cold water dripping on it will last longer than that in a dry drift, as the spores of dry rot are washed off the wet sets.

Metallurgical Development at Guanajuato.

Written for the MINING AND SCIENTIFIC PRESS
By T. A. RICKARD.

It is worth while to tell the story of the metallurgical development at the Sirena mill, more properly named *La Hacienda San Francisco de Pastita*. The successor to the old *patio* was a mill erected in 1899; it contained 20 stamps, each weighing 1,250 lb. The ore first passed through a 9 by 15-in. Blake crusher and was then reduced to 20-mesh by the stamps, from which it passed to six Boss rapid-grinding pans. Here it was re-ground, so that all save 5 to 10% passed an 80-mesh screen; and then it descended to 12 more pans and six settlers. From these the pulp went to five Wilfley tables. The capacity of the mill was 1,500 to 1,800 tons per month. The product was amalgam and concentrate.

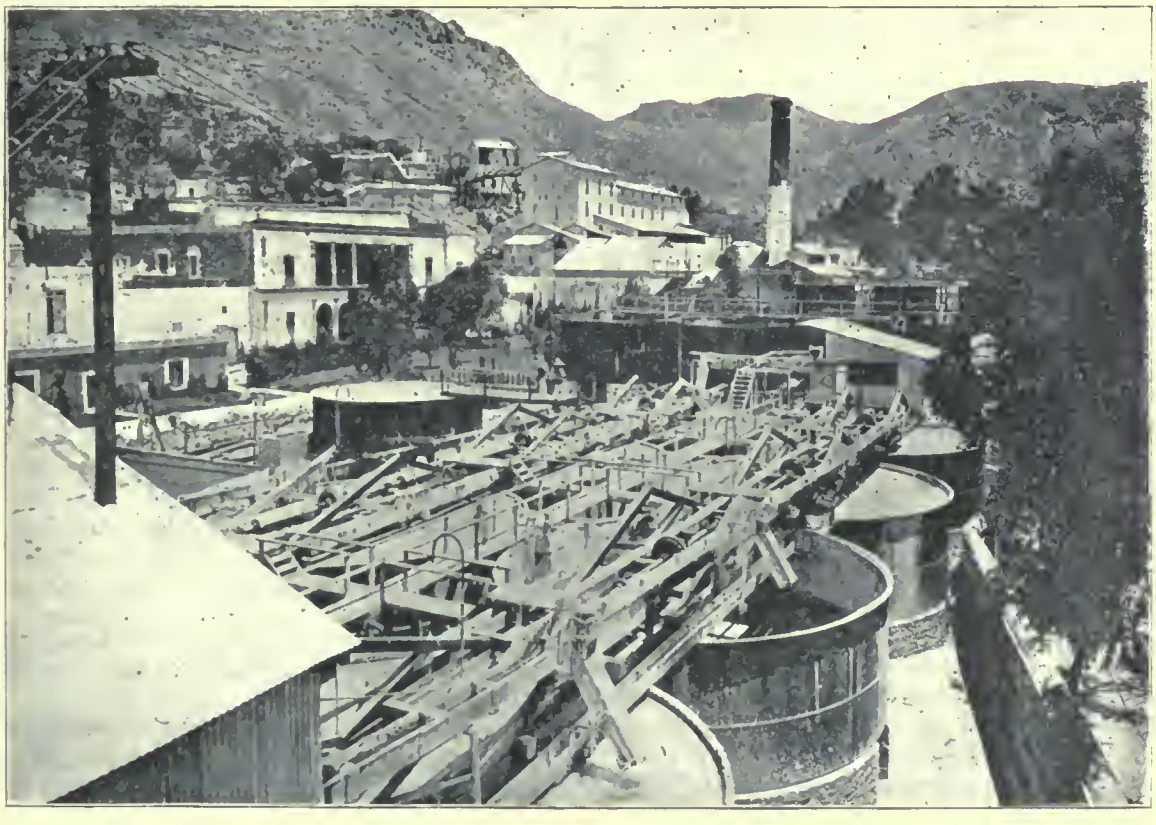
The pans extracted 65% of the assay-value and the concentrate contained 12% more. This was on the oxidized ore. Although the concentrate contained 2 kilo. or 61.2 oz. silver, it barely paid to send it to market under the smelter conditions then existing in that part of Mexico. However, another factor came into play; as the lower workings were opened up, the percentage of recovery by amalgamation fell off until it was only 60%. Concurrently, the consumption of mercury and copper sulphate in the pans increased, while the concentrate became richer—5 to 7 kilo. silver per ton. The method was changed; concentration was made to precede pan amalgamation.

By this new arrangement, the cost of milling was reduced from 7.86 *pesos* to 4.81. The concentration was carried further, so that the product contained 10 to 11 kilo. silver and 115 grams gold per ton; yet the weight of concentrate remained at two per cent of the crude ore. The higher recovery by concentration balanced the lower yield by amalgamation, the commercial result being less satisfactory because the precious metals in the form of amalgam were worth more than when enclosed within a concentrate that had to be transported to a distant smelter. Moreover, the variation in smelter rates introduced a factor of uncertainty.

Extraction finally fell below 60%. This suggested an increase in the mill, so as to lower the fixed charges. At this period the Government tax and the expenses in connection with realization of bullion amounted to 11% of its gross value. The poor extraction and the high imposts left but a small margin of profit. A search for better metallurgical treatment was undertaken. The cyanidation tests made by Leonard Holms in 1901 did not seem to justify turning to that method at that time; subsequently, however, E. M. Hamilton made a new research on a working basis, with a 5-ton plant, and he obtained encouraging results. However, nothing was done for a year.

Meanwhile the recovery by amalgamation continued to dwindle and when cyanidation was recommenced, there was a fear lest the further change in the ore with depth might affect extraction by cyanide as it had done that by mercury. In 1901, Bernard MacDonald was engaged to investigate the problem, with the idea, among others, that the Hendryx process might be applied. Complete cyanide tests were made and every kind of ore in the mine was tried. The results fully confirmed Hamilton's earlier work, even on the ore from the bottom of the Sirena mine. It was demonstrated that finer grinding was required and that even the concentrate, if ground dry to pass through 200 mesh, would yield 94 to 96% with the use of a 2.5% cyanide solution—a solution unusually strong, but based upon the relative proportion of silver to be dissolved. A weaker solution would have done better, as was proved later.

In these tests, a fresh solution was introduced each 24 hours into bottles that were agitated by being attached to the periphery of a slowly revolving wheel. This failed to reproduce working conditions, because it eliminated a drawback inevitable in practice—that is, foul solutions. For this reason the results were higher than was to be expected in the mill, but they warranted the belief that a plant specially designed for the treatment of



Reduction Works of the Guanajuato Con. Mining Company.

the concentrate, would yield larger profits than the sale of the concentrate to the smelters. The tests demonstrated also that the silver sulphide was readily attacked by cyanide when the grinding was as fine as 200 mesh. As yet, no plant has been erected to treat the concentrate, but it is likely that this will be done.

In the meanwhile—this was in April, 1904—it was decided to erect the existing cyanide plant, which started to work in May, 1905. When concentration was made to precede amalgamation, the grinding in pans was discontinued, it being found that amalgamation was most effective in charges instead of the continuous process. In erecting the cyanide annex, the only change required was to divert the flow from the Wilfley tables to cone-classifiers. The coarse sand went to a tube-mill of Allis-Chalmers make, 5 ft. diam. and 22 ft. long. It was lined with chilled iron, which, after a three weeks' run, collapsed, so that the use of the tube stopped abruptly. It has not been employed since. Tests proved that the benefit of the re-grinding in the tube hardly warranted the extra expense of repairs and power. The first cone-classifiers went out of commission, the pulp going from the Wilfleys to a set of cone-classifiers that separate the sand from the slime. The arrangement is shown herewith, in Fig. 1. *A* is a large spitzkasten, 8 ft. wide and 8 ft. deep, the classification being by gravity. The sand, plus some slime, flows through rubber goose-necks to a height two feet above the bottom into four smaller cones or spitzlutten, 4 ft. wide and 4 ft. deep, equipped with hydraulic jets. The undersize from all five cones unites to flow to eight Callow steel settling-cones, 8 ft. diam. and 8 ft. deep, where it is de-watered. Thence the pulp passes to three masonry vats, where lime is added to effect settling previous to decantation, at the same time destroying the acidity of the slime and bringing the positive alkalinity up to 1½ lb. lime per ton. Then this slime is pumped to the treatment-vats, the sand meanwhile going to collecting-vats from which it is taken, after draining, in cars to the treatment-vats.

This was the scheme at the commencement of cyanidation; subsequently the masonry vats, formerly employed in de-watering the pulp previous to pan amalgamation, were modified so as to serve for holding and thickening the slime. The five cone-classifiers were moved into the stamp-mill, in order not to lose grade, and in this new position they delivered direct into the masonry vats behind the old amalgamation pans, the vats built in the cyanide annex being used for the same purpose, namely, to de-water the slime. Even now it contains 70% water, and this 70% is just so much liquid that has to be displaced by the effective cyanide solution, until perfect diffusion is attained.

The ore goes from the Sirena mine to the mill in cars (Kilburn & Jacobs) of 50-cu. ft. capacity, carrying 2.4 tons each. They have a double side-dump, with gable bottom, and appear to work easily. Waste is removed by sorting in the big courtyard at the entrance of the main adit. A sorting belt is to be used at the new Soledad shaft, the waste then eliminated to be returned into the mine as filling. The belt is to be 50 ft. long, giving room for five men on each side and illuminated like a billiard table by shaded electric lights. Each man is to sit astride a wooden horse, which is high enough to give freedom of reach over the belt.

Gold can be seen in the surface ores of the Sirena mine; it accompanies the argentite. Pyrite does not appear to be indicative, nor is it a close associate, of the precious metals; it is more plentiful in the undigested country rock. In the ore of the Peregrina mine there is a little arsenical pyrite and also traces of antimonial silver minerals At Guanajuato generally, the average yield of concentrate does not exceed two per cent, carrying 150 to 1,600 oz. silver, and from 1 to 30 oz. gold per ton, so that the problem is to treat a small quantity of high-grade material, in competition with the expensive freight charges of the railroads and the heavy treatment rates of the smelters. Further, the Government tax is one per cent less on bullion than it is on the precious metals when in the form of concentrate.

In September, 1905, the mill treated 3,887 tons of ore, containing 517 grams of silver and 2.76 grams of gold per ton. On leaving the concentrators the pulp assayed 302.5 gm. silver and 1.46 gm. gold. The concentrate recovered amounted to 106 tons, averaging 948.06 gm. silver and 46.92 gm. gold. The cost of crushing and concentration amounted to 1.75 *pesos* per ton. The extraction by concentration was 50.1% of the silver and 49.1% of the gold.

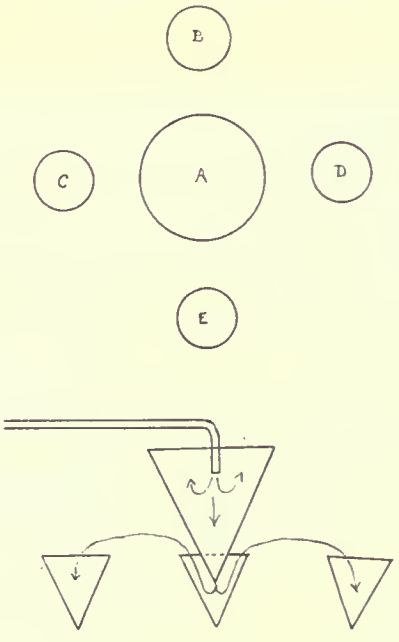


Fig. 1.

The practice is still in course of development and experiments are continually being made. Re-grinding does not seem required by the Sirena ore; it is stamped through a diagonal-slot screen equivalent to 40 mesh; a chuck-block is used. Of the resulting pulp, 80% goes through 100 mesh. The granular quartz, when crushed, readily liberates the silver sulphide, but the chalcedonic gangue in which the silver occurs (in a cloudy dissemination like moss agate), needs fine grinding—all of it—to pass at least 100 mesh. The concentrate carries 30% silica; the portion that passes through 200 mesh represents 15.5% by weight and as it is worth 398 *pesos* per ton, it contains 42% of the assay-value of the ore.

In watching the agitation in the slime vats, it was noticeable how the circular motion becomes accelerated until the moving mass of pulp and solution moves faster than the paddles. On starting the agitation, one can see the sinuous streaks of clear cyanide solution amid the slime, and this condition of imperfect dispersion is never wholly overcome; it is due to the resistance of slime to diffusion. I noticed this appearance (or phenomenou) in a vat that had been at work for 40 minutes. Another note; even ten minutes after the agitator is stopped, the movement of water at top of the vat continues in the direction started by the paddles. Two pounds of lime are added per ton of solution in order to hasten settlement of the slime. The philosophy of this has been discussed in connection with milling at El Oro.

The loss of sodium cyanide at the Sirena mill is 4.12 lb. per ton of crude ore, while the consumption of lime is at the rate of 6 lb., worth 12 *pesos* per metric ton. Sodium cyanide costs $15.75 per metric ton at Marfil station, the present terminus of the Mexican Central railroad, and to this must be added 1.25 *pesos*, or, say, 60 cents, for transport to the works, making the total cost $16.35 per metric ton of 2,204 pounds.

There is always some re-precipitation when treating silver sulphide, by reason of the formation of potassium sulphide, but this is diminished by the addition of lead acetate, which forms a plumbous hydrate that removes the soluble sulphides by forming a lead sulphide and the potassium or sodium hydrate. In practice, the re-precipitation of silver is surpassed by the re-dissolving of it in the cyanide solution.

By passing through cone-classifiers the product escaping from the upper mill is divided into 'sand' and 'slime,' which are treated separately, or in the cyanide annex. In the 'sand' department there were 20 vats, each containing an average charge of 2,651.7 cu. ft., or 89.6 tons. During the month 1,792 tons (dry) of sand was treated. The average assay-value before treatment was 297.5 gm. silver and 1.37 gm. gold; after treatment the contents were 52 gm. silver and 0.1 gm. gold. In the 'slime' department, there were 82 vats, each containing 3,851.8 cu. ft. of wet slime, equivalent to 24.26 tons dry. During the month 1,989 tons were treated. The average assay-value before treatment was 275.5 gm. silver and 1.3 gm. gold. After treatment the assay became 45.5 gm. silver and 0.1 gm. gold. The extraction was 85.1% as regards the silver and 70% of the gold in the pulp treated by the cyanide annex, the total recovery by cyanidation being 41% of the assay-value of the crude ore, so that the combined extraction by cyanidation and concentration was 91.2 per cent. The total cost of cyanidation was $1.13, and the consumption of cyanide 1.9 kilo. per ton.

Note should be made of the fact that successful experiments with cyanide on silver ore had been made earlier at the mines in Sinaloa, but the results had not been heralded because they were obtained at private properties, and even in these cases the official tests of the cyanide company at Mexico City had discouraged hope. The trouble was due to the use of too weak a solution—a swing of the pendulum in cyanide practice, for in its early days the main fault was the employment of a needlessly strong solution. Another factor, that prevented success with these silver ores, was the insufficient time given for chemical action. The element of time is especially important in the case of concentrate—iron pyrite carrying gold free and silver as argentite; the millman can afford to give the time required because of the small quantity of this product and its richness.

THE distance and direction in which power may be transmitted by rope-drives, using a large number of ropes, is practically unlimited. Satisfactory driving may be done where the distance between shafts is as great as 80 to 90 ft. without the aid of carrying-pulleys, while with such carriers the distance may be prolonged almost indefinitely. On the other hand successful driving can be done with ropes where the shafts are close together. There are many drives in operation whose sheaves are but 10 ft. or less, centre to centre. Where shafts are neither in the same line or plane, by properly placed guide-sheaves power may be transmitted around corners from one building to another, and in short between any two shafts in whatever relative position they may be.

Decisions Relating to Mining.

Specially Reported for the MINING AND SCIENTIFIC PRESS.

In an action to settle conflicting rights to a mining claim where the complaint is sufficient and where a sufficient adverse claim had been filed, a verdict in the form, "We, the jury, find the defendant guilty," was held sufficient to answer all the purposes of the proceeding.

Upton *v.* Santa Rita Min. Co., (N. Mex.) 89 Pac. 275. (Feb. '07).

In an action in support of an adverse to a mining claim, where a declaratory statement was introduced in evidence before any testimony had been given, showing that the steps necessary to be taken before a declaratory statement could be filed, had in fact been taken by the locator, and the statement having been followed by the necessary proof, it was held that the admission of such declaratory statement out of its order was immaterial and without prejudice. And the admission in evidence of an original declaratory statement, defective in that it failed to sufficiently describe a discovery shaft, was admissible in evidence, in connection with the amended declaratory statement, as showing an attempt on the part of the locator to comply with the law and the identity of the claim described in the two statements.

Butte Consol. Min. Co. *v.* Barker (Mont.), 89, Pac. 302 (March, '07).

A statute of Montana provides that the locator of a mining claim must sink a discovery shaft on the lode or claim to the depth of at least 10 ft., or deeper if necessary, to show a well-defined crevice or valuable deposit; but it is also provided that a cross-cut, which cuts the lode at the depth of 10 ft. below the surface, is equivalent to the discovery shaft. The statute also provides for the filing for record of a declaratory statement, which, among other things, shall state the dimensions and location of the discovery shaft or its equivalent sunk upon the claim. But under these statutes where it appeared that a cross-cut intersected the vein on a claim 132 ft. below the surface, but that the only means of reaching such cross-cut was down a shaft located upon another patented claim, it was held that such cross-cut, even if made by defendant, did not meet the requirements of the statute for development work, and no other work having been done, there was no valid location of the claim.

Butte Consol. Min. Co. *v.* Barker (Mont.), 89, Pac. 302 (March, '07).

In an action to determine the title to a mining claim the complaint or declaration should contain, in addition to the ordinary allegations in ejectment, appropriate allegations showing the fact that such action is designed as an adverse suit.

Upton *v.* Santa Rita Min. Co., (N. Mex.) 89 Pac. 275. (Feb. '07).

The rule has been declared that the working of a mine for the statutory period before the adverse right exists, is equivalent to a location under the Act of Congress. As said by the Court: "In other words, a party who had done such work occupies the status and possesses the rights of a locator, no more and no less. As in the case of a holder of a valid location, he has good title as against all but the Government, so long as he does the annual labor." The holder of such a possession, no less than the holder of a location, must possess the necessary qualifications as to citizenship, and he must prove, as well as the locator, the possession of $500 worth of labor or improvements before he can secure a patent, and pending his right to patent, he must perform the annual assessment required of the locator by the statute.

Upton *v.* Santa Rita Min. Co., (N. Mex.) 89 Pac. 275. (Feb. '07).

Concerning Costs.

Written for the MINING AND SCIENTIFIC PRESS
By GEORGE HUSTON.

A highly important factor in a going mining concern is its system of accounts. There are many crooks and turns in the business, there is many a colored gentleman in the woodpile, and where the abuses are greatest they are least apparent. In the organization in which the mine manager has the choice of the system, he has also an opportunity for concealment of conditions. He can, by the adoption of a certain system, make a better showing than a more capable man, and thus deprive the investor of the benefit of competitive talent. The investor is invited to study the following tale and its moral. The tale is founded on fact :

Manager No. 1 was in charge of a silver-lead property, with a fine mine and mill of 500 tons capacity. Nature had been most generous to his mine. The veins were large, heavy in commercial metal, and rather low in grade. The problem was to extract the valuable portion of the ore in order to pay a profit and provide for future development, and this with a loss in the tailing as small as was consistent with the current practice and the economic limit in costs. He did not believe in crushing a large amount of material in order to secure certain results at the expense of efficiency and the ore reserves in the mine.

In this case, the unit on which costs were based was the pound of lead and the ounce of silver extracted. That is, he figured his costs against the amount of metal extracted. His constant effort was to increase the output, at the same time keeping his costs stationary or reducing them. Thorough weighing and sampling at the mill was practiced in order to determine the pounds of lead and ounces of silver contained in the tonnage mined and treated. Every increase in output, with stationary costs, gave a larger surface on which to spread expenses, with a consequent reduction of the latter. We may add, that the gentleman was a good patron of the technical journals in more ways than one. He was a painstaking reader, always on the lookout for practical ideas; the manufacturer of improved appliances and machinery loved him, because he knew his effort would be appreciated in a substantial manner by profitable business. For this reason the technical journal enjoyed good profit from the manufacturer's advertisements and thus was repaid for its labor and talent in providing helpful reading matter for the manager.

No. 1 knew the value of up-to-date appliances. He did not hesitate to scrap old plant, if the new would improve matters. If the labor cost increased through higher wages, or if the assay of the ore ran lower than usual, he promptly turned to his plant to increase capacity or to adopt some method for higher saving at less cost, in order to provide more of a cost-carrying medium and to maintain his dividends. No. 1 knew his business from A to Z and the system kept him keyed up to his work. He always employed the best class of labor, seldom had a disagreement, realizing that his success depended on co-operation and he did his best to instill this doctrine, and thus keep the force efficient. As for the stockholders, they were proud of him. The only cost given in the reports to them were those per pound and ounce, and the prices realized. This was easy to understand and the setbacks were met by honest explanations.

It came to pass that No. 1's record got noised abroad, the result being, the receiving of flattering offers of positions giving a greater scope for the energies and talent of the man. He had earned his spurs and was really too good a man to keep in a small concern. He accepted, and Manager No. 2 was duly installed in his place.

No. 2 did not possess the energy or ability of the former incumbent. The staff and force soon got to know this and the tension was relaxed. He knew the mining end of his work but was lamentably deficient in the milling. The mill was really the profit-maker. The manager was compelled to rely on his mill-staff for efficiency, but not being master of the knowledge necessary to conduct operations, his errors led to trouble. One of his first acts was to reduce expenses, the first item to be cut off the list was the efficient sampling arrangement of his predecessor. What need was there of sampling in the mill, when the tailing was sampled and the ore also? The assay of the mill-feed could be ascertained well enough by approximation. The men took the cue, having no check put on them, and taking their own samples, got results to clear themselves. The practice promptly deteriorated, and after a three months' trial, No. 2 saw that he could not hope to equal the record of No. 1 by treating the same tonnage, wherefore he evolved a new system of cost-keeping. Instead of figuring against the pound of lead and ounce of silver recovered, he placed costs on the ton of mill-feed treated. In order to show the same number of pounds of lead and ounces of silver recovered, he jammed through the mill the additional tonnage necessary. The consequence was, the mill had to take care of 750 tons instead of 500. The machines were constantly overloaded and did poor work. There was a big loss in the tailing. The mill superintendent was harassed to keep down costs, and the plant suffered accordingly.

The argument of No. 2 was that the stockholders wanted dividends only. Having the machinery of concealment in his hands, he gave them returns at the expense of the ore reserves, in order to hide the fact that his ability as manager was below the standard established by his predecessor. He also knew that he had a cinch on the position as long as the ore reserves held out. It is true, the facts appeared to leak out when men were put to re-work the creek-bed below the mill for the metals he had thrown away. But he harassed and hampered such operations, through his influence with the transportation companies and others. Meanwhile, in the milling plant, improvements came to an end. It would not do to raise the expense, so why improve? Instead of being a thorough student of up-to-date methods and appliances, he cut out another expense; namely, the subscription list to the technical journals. Not being a patron of the manufacturer of improved appliances, the journal suffered because of the system, from failure to stimulate the manufacturers' market.

The reports furnished to the stockholders were beautiful documents, abounding in nebulous items, such as the cost per ton for screens, for crusher shells, and so forth. The American stockholder is a notoriously apathetic individual. At first they confused, then the reports were flung aside. What need to bother as long as dividends came regularly?

The baneful results of the system became apparent in the conduct of the force. The constant effort to reduce expense regardless of the extraction, undermined efficiency. The employee became a machine, whose only value was the amount of working effort he made. No recognition was given to special talent or good suggestions. Suggestions meant improvements, and improvements meant expense per ton treated, because of the extra installation required. The system grew more and more expensive through having to break in new men for skilled work at the company's expense. As fast as they were trained,

they left for a more congenial position with neighboring companies.

Here ends the story; the stockholder can draw his own conclusions.

There is no valid reason why a system of cost-keeping cannot be evolved to render the operations of such managers as No. 2 impossible. There should be healthy rivalry between managers, just as in any other business. Three months of office for manager No. 2 on No. 1's system would have demonstrated his incompetency and resulted in his displacement. Had the stockholders been alive to one check, that of doing the sampling at the mill independently, in their own interest, they could have prevented the abuse of the ore reserves, in his effort to conceal deficiencies. Manager No. 1 was a good man, but No. 2's system had the effect of minimizing the good results, and of doing an injustice to him.

The state of affairs outlined is by no means uncommon. More education is needed in these matters in order to give the mining industry a better place in the confidence of the investor.

Letters of a Self-Made Miner to His New Foreman.—II.

Written for the MINING AND SCIENTIFIC PRESS
By MATT. W. ALDERSON.

My dear Tom:

Most mine managers seem to think that when they have hired a miner that is all there is to it; and they put him at work at any place in the mine where they wish work done. That is not my way of doings things. I wish you to make a study of your men and to place them where they will work to best advantage. There is no man who cannot do some things better than he can others. If you have a man who is good at a drive, keep him at it. But don't put a good shaft man to making a raise, nor a man whose forte is putting in uppers to sinking a winze.

You should know every man on the force who has had experience in blacksmithing, timbering, etc.; so, in case of the illness or the absence of the regular man you will know whom to put in his place. And when you take a man from his regular work and put him at something for which a higher wage is paid, see that he is credited accordingly, even though his work is far from satisfactory.

You should know every left-handed man, every double-hand man, every man who can strike right and left double-handed, every machine man, every man who is skilled in any one particular thing, so, in case you may have need for just such a person you can call him aside instantly, instead of having to make a hunt for the man when time may be precious.

I have had men who were utterly miserable if they were compelled to work off in an isolated locality all by themselves. Some foremen would keep a man in such a place just to show that they were boss. Don't do it. Humor the peculiarities and idiosyncracies of your men, not at their request, but before they ask it; not wholly because they wish it, but because it is to your interest to have them work where they will be happy.

You will have some men who will be splendid workers, but untidy. If such men mucked out after themselves they would leave windrows of broken ground on the floor behind them. Put such men at work where the vein is narrow and it is important to keep the ore separate from the waste, and they would not only be uncomfortable, but would often wonder which was the ore and which the waste. Keep such men either on development work, or in a stope where the vein is wide, and where it will be impossible for valuable ore to get mixed with the waste. On the narrow vein put a man whom you know to have good order, and who exercises his saving faculties. Such a man will take pleasure in making a clean separation, and every ounce of rich ore will be too precious to him to find a place in the waste.

I put a new man at work one time in a large stope where the hanging wall was very firm and we used few timbers. I was soon aware that he was exceedingly uncomfortable. He was continually apprehensive that the roof was going to cave in on him. He was intelligent, and I endeavored to allay his fears; but I could see, after a few days, that unless I changed his location I was likely to lose him, for he was apt at any time to be carried away by an irresistible panic. I took him out and put him at work driving through loose ground where several men had refused to work, where, even with the best men I could get, the ground would make runs on us, and we would be at great expense catching it up and getting under way again. In this place my new man was in his element. Frightened half to death in a safe place, he was perfectly happy doing the most dangerous work in the mine. No imaginary dangers oppressed his mind here. He was face to face with one he could see, and he knew he had intellect enough to avert it. He had so much caution that he never once let a run get started, and he braced his timbers so solidly as he went along that no one of them could have been moved a quarter of an inch.

I do not mention these things as examples of what you are to do under similar circumstances, for I recognize that conditions in this world are seldom, if ever, twice the same; neither do I seek to give you the impression that I am a very smart man, for no one knows better than I that I could not successfully pass an ordinary high-school examination, but I wish to emphasize the fact that to make a successful foreman you must understand your men. It is not enough that you take each man's estimate of himself. You should know from your own observations just what each man can do to best advantage.

A good wheel-horse will settle back on his haunches and let himself be dragged to the bottom of a hill before he would let the load get beyond his control. A good lead-horse, when not pulling, will walk along and step lively at times just so the singletree will not strike at his heels. We would call a man a fool who would put his wheel-horses on the lead and the leaders on the wheel. There is just as much difference in men as in horses, whether most persons recognize it or not; and I shall expect you to know your men and to place them intelligently.

Sincerely yours,

TIMOTHY STRONG.

ELECTRIC SMELTING BONUS.—The Government of the Dominion of Canada has granted a bonus on all ore smelted by electricity. The decision is the outcome of what are said to have been successful experiments made at the Sault, under the supervision of the Government. The bounties are as follows: On pig iron manufactured from Canadian ore by the process of electric smelting, during the calendar years: 1909, $2.10 per ton; 1910, $2.10 per ton; 1911, $1.70 per ton; 1912, 90 cents per ton. On steel ingots manufactured by electric process direct from Canadian ore and on steel ingots manufactured by electric process from pig iron smelted in Canada by electricity, from Canadian ore, during the calendar years: 1909, $1.65 per ton; 1910, $1.65 per ton; 1911, $1.05 per ton; 1912, 60 cents per ton.

On the Rand.

The accompanying photographs from Johannesburg were given to us by Mr. J. B. Pitchford, who kindly added the following notes:

Fig. 1 shows a 400-stamp mill in course of construction in 1898 for the Simmer East and Knights Deep mines. In this design vertical-compound mill-engines are placed in the middle of the building, driving 200 stamps on each side. The mill framing is of Oregon pine. The sides and roofing are No. 24 corrugated galvanized iron, which is extensively used on South African mine buildings and affords better protection against the spread of fire than boarding. This mill is now running and the portion equipped with tube-mills crushes nearly eight tons per stamp. The water used is about 7½ tons per ton of ore. The coal used in large mills amounts to 50 to 60 lb. per ton of ore crushed. This mill, with the cyanide and slime plant, sorting-house, precipitation-house, and refineries, cost about $2,500,000.

Fig. 2 illustrates the foundations for the battery, ore-bins, and battery line-shafts of a 220-stamp mill erected on the Cason mine, on the East Rand. This is a back-to-back battery with an electric motor at the outer ends of the line-shafts, which drive 110 stamps each. The concrete work costs $13 to $14 per cubic yard finished. The cement cost $7.70 per bbl.; labor was $4.36 per yd., and boxes, 75 cents per yard.

There being a small amount of slope to the ground at Johannesburg, tailing-wheels are used to elevate the battery-sand in order to distribute it to the cyanide vats. A few mines use plunger-pumps. Two or three mines use the Pohle air-lift, but 90% use tailing-wheels. They vary at different mines from 25 to 60 ft. in diameter. Some are built with wooden arms, some with channel-shaped steel arms, and others on the bicycle principle, with steel arms in tension. The wheels having sheet-steel rims usually have the buckets made of wood, as it stands the action of the sand better than steel or iron, and the worn parts can be readily renewed. The bicycle

Robinson Randfontein	58	46	12	21	12	47	81	455	Single.
Robinson G. M	46	35	12	15	12	36	80	578	Single.

TURKISH SALT PRODUCTION.—The total average annual production of salt in the vilayet of Smyrna is 167,640,000 lb., the net cost of the product being 5.04 cents per 212 lb. The consul thus describes the industry: At Teham-Alti a certain kind of salt is collected from sea water, which is very much sought after by the Turks. It bears the name of *keupuk touzou*, which means 'froth salt.' It is collected from the salt pans when the crystallization on the surface of the water is just beginning, when the surface ruffled by the wind, which blows intermittently, becomes all froth. In order to secure a large quantity it is essential to collect it promptly and at an opportune time, otherwise it readily mixes again with the ordinary salt when this begins to form. The Turkish administration of the public debt has built four large depots at Phocia, which will store 94,600,000 lb. of salt. These depots are situated at about 20 nautical miles from this port. Large quantities of salt are shipped to the various ports of the Mediterranean in sailing vessels. Even with these large shipments the production still exceeds the demand and attempts are now being made to supply even Australia with salt from Turkey.

The Sodium Nitrate Deposits of the Colorado.

Written for the MINING AND SCIENTIFIC PRESS
By H. W. TURNER.

In the summer of 1904, I had occasion to investigate certain deposits of sodium nitrate along the Colorado river, south of the Needles. Much interest in these deposits was aroused, and several square miles of land were located. The sodium nitrate deposits of the Death Valley region had been much advertised and their value exaggerated, so the discovery of similar deposits further south naturally attracted prospectors.

In the examination, I was assisted by J. H. Hartley. Many qualitative tests were made in the field, but the quantitative analyses were made by J. W. Howson, as well as by Harry East Miller. The district surveyed extended from the point where the Santa Fe railroad crosses the Colorado in San Bernardino county south to a peak locally known as Vivet Eye, in Riverside county. Subsequently J. H. Hartley went down the Colorado river from Needles to Yuma on a flat boat and found indications of sodium nitrate at other points farther south.

The region is extremely desolate, and in the summer, so warm that we preferred traveling as much as possible by night. The larger part of the area is occupied by the usual slopes of detritus, sparsely covered with spiny vegetation, with large tracts of soft lake-beds and of volcanic rock, chiefly tuff and breccia. Rising above these formations are higher ridges composed usually of older rocks, granite, schist, and limestone. The evidence goes to show that the volcanic formations are older than the lake-beds, as the latter rest unconformably on them. The lake-beds are made up chiefly of soft shale, usually lying in nearly horizontal beds. These are probably of fresh-water origin and perhaps belong to the same Pleistocene time as the famous Lahontan beds of Nevada. At one point, however, evidence of a still older series of lake deposits was noted near West Well in San Bernardino county.

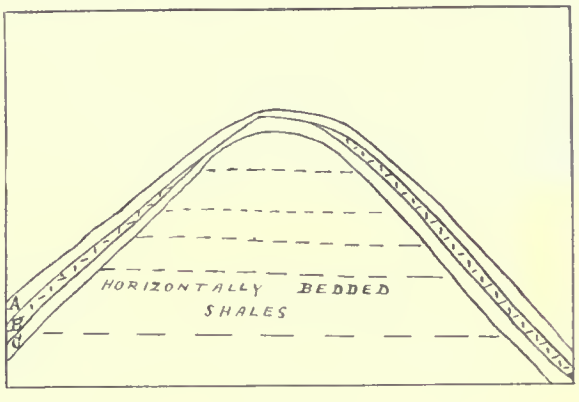

Fig. 2.

Special examinations for nitrates were made at four localities, as shown on the map (Fig. 1), namely: Topoc, West Well, certain hills composed of lake-beds at the south border of the Colorado River Indian reservation in Arizona, and the Vivet Eye area.

The nitrates were found in three forms: As an efflorescence chiefly on porous volcanic breccias, in the shales of the lake-beds, and deposits on the hill-slopes associated with the other salts and travertine.

In protected places on volcanic rocks, patches of white salts were found to contain sodium nitrate up to 1.5%, with much sodium chloride. It required but a few blasts, however, to demonstrate that the deposits were a mere surface efflorescence, as a foot or two below, the rock contained only traces.

Thus at one spot we found sodium nitrate:

	Per cent
At the surface	1.54
Two feet below the surface	0.16
Two and a half feet below the surface	0.19

The chlorides and nitrates of sodium on these volcanic rocks, both in the Topoc area and near West Well, appear thus to owe their origin to moisture impregnated with these salts being sucked up by the heat; on evaporating, the saline material is left as a white coating on the rock. Such salts are very soluble in water, and it is only in protected places that they accumulate. The salts were probably primarily derived from the lake shales, which are adjacent.

In the Topoc area, near West Wall, south of Parker in Arizona, and at many other points, there are extensive layers of a greenish shale in the lake-beds, and these shales nearly always give a reaction for sodium nitrate. These beds are much cut up by gulches and the surface is usually crusted over by a mud formed by the slacking of the shale during rains. This crust (*A*) usually gives a reaction for nitrates and other salts, but, immediately under it, there is frequently a white layer (*B*) richer in soda and lime salts. Frequently layer *B* is wanting. Finally, resting on the undisturbed shale is a third layer

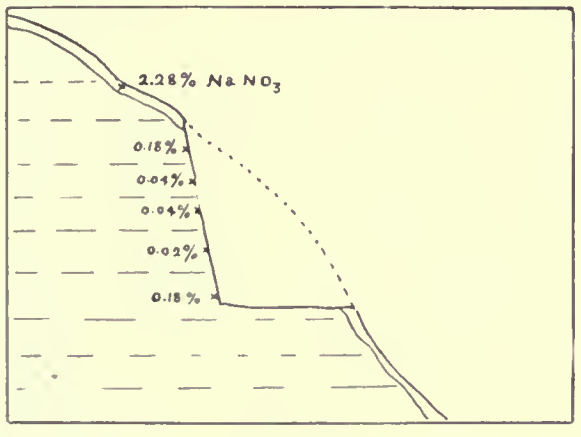

Fig. 3.

(*C*) from 3 to 12 in. thick, composed of broken bits of shale, and this lower layer usually shows a strong reaction for sodium nitrate.

Fig. 2 illustrates three layers, conforming to the general slope of which they form a part.

If now we cut through these surface deposits into the undisturbed underlying shale, we find usually a sudden decrease in the content of salts, and conclude that the larger content of salts in the surface layers is due to leaching by the rain-water from the shale, which breaks and slacks when wet. These salts are then re-deposited immediately under the mud crust in layers *B* and *C*, as shown in Fig. 2.

The decrease in the sodium nitrate content is illustrated in Fig. 3.

In the Topoc area, the shale showed a larger content of sodium nitrate than at the other points, as indicated by the following analyses by James W. Howson:

Number.	Per cent Sodium Nitrate.
1	1.90
2	3.23
3	0.76
4	4.08
10	3.80
11	2.19
12	1.14

In the deposits south of Parker on the Arizona side of the river, three different layers (Fig. 4) of greenish shale gave reactions for sodium nitrate, but the lowest layer was richest (1.96%) in this salt and this layer was reddish in color.

Finding no deposits of any commercial value in the volcanic and shale series, we proceeded south to Vivet Eye, where material of a better grade was promised.

Riverside Peak lies at the west border of the Colorado River Indian reservation. About a mile to the southwest and forming part of the same general ridge, is a peak locally known as Vivet Eye. In ascending this peak from the Colorado river, one passes first over limestone and dolomite beds probably of Paleozoic age; next over a series of green schists; then comes the limestone that forms the summit of Vivet Eye. These three terranes have a general north-south strike and dip at a steep angle.

The zone of green schist is largely obscured by fragments of schist that have been cemented by a porous deposit of carbonate of lime resembling travertine, mixed with varying amounts of white salts. This cemented material, evidently of recent origin, is sometimes 20 ft. or more in thickness. The travertine evidently owes its origin to the action of surface waters on the adjacent limestone, and the salts were presumably derived from former lake-beds now largely eroded by capillary attraction acting during a long space of time; waters impregnated with salts drawn from below, and evaporating re-

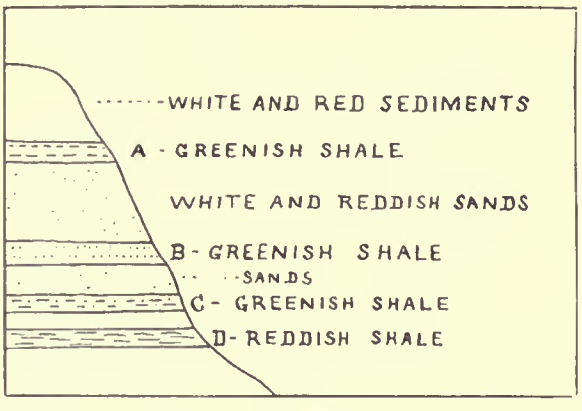

Fig. 4.

main at the surface, impregnating the porous breccia-mass of schist fragments and travertine. This deposit would thus be similar in origin to the efflorescence deposits of the volcanic rocks, but the conditions at Vivet Eye being more favorable, a greater accumulation of the salts has taken place.

A number of cuts were made in the cement-breccia of Vivet Eye, and here also the content of sodium nitrate was found rapidly to diminish with depth. At some points, however, nearly pure deposits of white salts a foot or more thick, were observed, and subsequent analyses showed several salts were present, including sodium sulphate, sodium chloride, calcium chloride, magnesium sulphate, potassium sulphate, potassium nitrate, and sodium nitrate. In one sample, 7.8% sodium nitrate was found, and in another 14.4%. The total acreage of the Vivet Eye nitrate deposits may equal 10 square miles or more, and this was the most promising of all the deposits seen. Nothing at all comparable to the Chile deposits was anywhere observed, nor is it to be expected.

The Chile deposits that are most profitable appear to have been formed by surface waters from the Andes percolating down to the plains between the Andes and the Coast range, and depositing there their salt contents. In the plains there is no rain and no run off, and hence the salts once deposited are preserved. In the Colorado basin, there are occasional rains, and the lake-beds drain into the Colorado river, which probably yearly *decreases* the total quantity of nitrates and other soluble salts in the basin.

The Murray Gold Belt, Idaho.

Written for the MINING AND SCIENTIFIC PRESS
By THEO. L. LAMMERS.

Murray, in Shoshone county, Idaho, is, I believe, the oldest camp in the Cœur d'Alene, and it was formerly wholly devoted to gold mining. There are today several lead-silver mines in the vicinity, but these are all later locations and east of the gold belt. In several of the gulches southwest of Murray, between Murray and Wallace, there are a number of gold veins. In the vicinity of Osborne, on the Oregon Railroad & Navigation Co.'s line between Wallace and Wardner, the same formation with the same gold-bearing veins is found, also with a number of old locations. I had the opportunity recently of examining these veins at different places; and it appears to me that a large sheet of gold-bearing quartz extends from a little northeast of Murray to some distance southwest of Osborne; thus extending in a direction a little east of north for about 25 miles, with a width of probably 8 to 10 miles. To be sure, between Pony gulch and Osborne, a distance of about 12 miles, I have not examined the formations; in this territory there are no prospects or locations, as far as I know. But there is every reason to suppose that the formation extends unbroken through this distance, although lying deeper. And if there are no gold prospects in this distance, neither are there any silver-lead prospects, which latter belong to a distinctly different and later formation.

As usual, the placer deposits were first worked before any attention was paid to the quartz veins. Around Murray and Delta a number of placers have been worked, and some of them have yielded well; in fact, there is still a good deal of placer mining on a small scale in the various gulches in this territory. All this gravel has undoubtedly originated from the quartz sheets. Murray was the largest camp in the district, and almost all the gravel washed here was found on the hillsides north of the gulch. The main gulch, through which Pritchard creek flows, is one large gravel bed, generally of rather low value, and mainly near, or on, the bedrock; but in a few instances some richer pockets appear to have been worked by sinking and driving.

This main gulch would appear to have been created by a fault, with considerable throw, which I, however, have made no effort to determine; the south side of the gulch is steep, in places precipitous, and the gold-bearing quartz blankets crop out along the hillside at an elevation of about 500 ft. On the north side of the gulch, which is much less steep, the veins crop out 300 ft. above the creek.

I am speaking of a quartz sheet, but there are really two or three sheets with a vertical distance between them of from 30 to 50 ft. These sheets lie sometimes almost horizontal, sometimes with a dip a little south of west. I think the steepest dip observed at any place is about 45°. The underlying formation is a quartzite, in which lies one, possibly two, quartz sheets; on the quartzite lies another, and this is again covered by an old metamorphic schist. The quartz sheets are thus only visible where deeper gulches have been cut in the mountains either by faulting, or denudation, or both.

The formation, including the quartz deposits, has been extensively faulted. Frequent dikes of trachyte, a few feet thick, penetrate the country with a nearly vertical dip; these dikes, running about NW-SE, have all faulted the quartz sheets, causing steps of from one to five and six feet, ascending going west, descending toward the east. Some faults have been much bigger; thus in Pony gulch I observed a vein, about 15 ft. wide, with a strike of N 55° W, dip 82° northeast, which cuts through the quartz blankets, raising the easterly side nearly 300 ft. above the westerly. These trachyte dikes and veins, cutting and faulting the quartz sheets, apparently belong to the later vein formation, to which belong the great silver-lead bearing lodes of this district. Indeed, similar dikes occur, generally cutting through the silver-lead veins, although not faulting them, and, I think, almost invariably in the close vicinity of orebodies, a fact that points to these dikes as the ore-makers, or closely associated with the silver-lead ores.

As to the origin of these quartz sheets, I am not at all clear. Their large extent would seem to argue against any igneous nature, or as created by deposition in a fissure or by replacement. And in various places they certainly give the impression of being of sedimentary origin. I have seen quartz deposits in vein form in limestone, evidently by chemical replacement, where I have found what appeared to be the original fissure, nearly perpendicular, through which the mineral-bearing solutions probably ascended. But I have observed nothing of the kind in this case. On the other hand, in at least one place, in the Golden Chest mine at Murray, there is a comparatively rich ore-shoot, in which the gangue contains scheelite—a fact that suggests an igneous origin.

The mineralization of the quartz sheets consists principally of pyrite and arseno-pyrite, with free gold; there is only a little silver. Chalcopyrite and galena occur sparingly. The mineralization in the vertical vein on Pony gulch, mentioned as cutting and faulting the quartz sheets, is entirely different, for it consists, in the outcrop, of heavy iron and manganese oxides, containing gold and silver, and showing galena in depth.

Along Pritchard creek, close to Murray, and between Murray and Delta, a number of mines have been opened and worked on these quartz sheets. They have all been pocket mines, that is, they have been opened on some higher-grade body of ore, and the mining has been confined to the extraction of this ore, neglecting any further development; almost all of these mines are now considered as worked out. I believe there is only one of them in operation, namely, the Golden Chest mine. There is, however, some prospecting being done on several claims. One of these, the Pilot, caused excitement about a year ago by suddenly disclosing a very rich shoot or lens, with ore running several thousand dollars per ton. Owing to various business arrangements, no serious development followed upon this discovery.

Most of these old mines have been equipped with small stamp-mills and, I presume on account of high expenses, they have had to confine themselves to high-grade ore. The mining seems to have been confined to extracting this high-grade stuff, neglecting development work. But it is doubtful whether these mines really are worked out. The high-grade lenses, to be sure, have been extracted; but there is gold all through this quartz deposit, and while certainly parts of it are too poor to be mined profitably, still, where I have examined and sampled it, the deposit would seem capable of furnishing a large tonnage of pay-ore, of low grade. What might be considered pay-ore would, of course, vary according to the operating expenses. Some claims on this deposit could certainly be mined at a minimum expense.

The Golden Chest mine, the most developed property in the district, shows bodies of good ore, which will probably average from $10 to $12 per ton in gold; this does not include the high-grade material. Twenty-five samples from various openings on the upper quartz sheet in another locality, where the deposit lies nearly flat, gave me an average value of $8.90 per ton in gold; and three samples from higher-grade lenses gave an average of $64 per ton. At the same time, samples could be

taken from these same openings that yielded only one or two dollars per ton. Evidently, part of the deposit would thus be too low-grade to admit of profitable extraction; probably one-fifth or one-fourth. At the same time, workings might at any time open up bodies of high-grade ore. While the quartz everywhere contains some gold, the metal appears to be concentrated in zones or lenses. As far as I have been able to observe, there are no special signs or indications to show when and where this concentration may be found, nor to indicate the end or limit of it. While the trachyte dikes seem to have some connection with the orebodies in the silver-lead veins, in these quartz sheets they do not appear to have any connection or bearing on the value of the ore, as is only natural, seeing that the dikes are of a much later formation. I would say, however, that it would hardly be profitable to work this deposit only for the high-grade bodies which might be encountered, and that to work the deposit as a whole profitably, it would be necessary to have conditions fairly favorable to cheap mining, with such equipment and openings as to be able to extract a large tonnage.

About two miles west of Osborne, on the north side of the valley through which flows the south fork of the Cœur d'Alene river (the O. R. & N. railroad follows this river up to Wallace), is located the Evolution mine, one of the old gold locations. This mine is opened on the same quartz sheets, which here show the same character, the same mineralization, and are similarly cut and faulted by trachyte dikes. The mine has been worked only by 'fits and starts,' and has not, as far as I know, made any production worth mention. Opposite this mine, on the south side of the valley, I have seen the outcrops of two of these quartz sheets. They have been prospected a little, and opened by inclines 50 to 60 ft. deep. The deposit here also dips southwesterly at an angle of 15 to 20°; the sheets are also cut and faulted by narrow trachyte dikes, so that raises have been made from the inclines to catch the continuation of the deposit.

The mineralization of the quartz here is virtually the same as in the Murray district; but in one place I found more galena than it usually carries, getting about 30% lead in one sample. H. S. Auerbach, the manager of the Golden Chest mine, tells me, however, that in one of the ore-shoots in that mine he finds considerable galena.

The thickness of the upper sheet is here from five to six feet. This is probably a little more than the average thickness, which I should estimate at about four feet; I have seen it in places only one or two feet thick, swelling to eight or nine feet.

While my investigations of this deposit have not been detailed, it appeared to me to be of considerable interest, both geologically and from the point of view of the miner.

COAL MINING IN ENGLAND.—The almost unexampled high prices of coal in Great Britain since last autumn, caused by the great demand due to the general prosperity and the severe winter, have led to work upon disused collieries and the prospecting for and opening of new ones. At several points about Nottingham new borings are being made, but the greatest activity in the district is in Lincolnshire. That county has hitherto produced no coal worth mentioning, though a belief has long existed that coal underlay it, and a recent report of the Royal Commission on Coal Supplies confirmed the belief as a fact. In a dozen different places new shafts are being sunk in Lincolnshire, and in several cases coal has been reached. The borings are generally to the depth of 600 to 900 yd. Some grades of house coal have recently declined a shilling (24 cents) per ton to the consumer, in comparison with midwinter prices. But this change occurs every spring. Coals for raising steam are, on the contrary, firm in price, and predictions are heard that they will yet further advance, possibly as much as $1 per ton.

Immigration Bureaus.

A recent railroad accident in California, in which more than a score of Italian laborers were killed and many badly injured, developed a rather curious phase of the labor problem. It was remarked by many people that the laborers were from Eastern points, more than half having come from New York, and were on their way to a mine in this State, where their services had been engaged through one of the Eastern employment bureaus. While the alien labor laws prohibit the employment of foreigners or the promise of work, which amounts to the same thing, before the immigrants have landed, the immigration authorities take good care that our future citizens are well looked after when once they arrive. They take the trouble to see that those who are not welcomed by relatives or friends are put under the charge of men who make it their business to find work of suitable kind, so as to prevent them from becoming a public charge. Of course, these men do not perform this duty gratuitously, but it is a fact that in serving their own interests they manage to take good care of the many thousands who come to us each week unable to speak our language and who would otherwise be the prey of sharpers, who frequent the water-fronts of all the large seaports. The employment bureaus, as businesses conducted for this purpose are called, being in such close touch with the immigration commissioners, are frequently the means of ridding us of many undesirable foreigners, who have escaped from the crews of vessels without having been passed on by the proper authorities. Almost invariably such foreigners are detained and subsequently deported.

For a number of years many mines in the East have had laborers supplied to them by the employment bureaus, and have nothing but good to say of the system. The Delaware & Hudson, through the Southern Immigration Bureau of New York City, is among the large mine-owners that have benefited by the careful selection of men trained to pick out the foreigners best suited for various kinds of work. In the past two years these agencies have extended their field of work and they now send every month many hundreds of laborers to work in the mining camps of the West.

IN ITS simplest form, a caisson is an iron cylinder somewhat bell-shaped, open at its lower extremity and closed by sliding doors at its upper. Leading out of the upper part on one side is a chamber called an air-lock which is separated from the interior of the caisson by an iron door, and also from the outside by similar means. It is through this air-lock that the men enter and leave the caisson. Between the sliding doors at the upper part, or movable ceiling of the caisson, and the roof is a chamber or space known as the material lock, through which the buckets filled with soil are passed. When placed in position, the bell-shaped expansion of the caisson rests upon the bed of the river, and atmospheric air under pressure is pumped in. This by displacing the water enables the men to work in a pneumatic chamber wherein they are dependent for the air they breathe upon that delivered into the caisson by pipes from an engine, and as the surplus of air escapes by the bottom of the caisson ventilation is by this means effectively secured.

Treatment of Matte from the Cyanide Mill.

Written for the MINING AND SCIENTIFIC PRESS
By A. E. DRUCKER.

It may be of interest to some to know of a quick and complete way in which to extract the metals from a rich matte as obtained at a cyanide clean-up. It often happens that the yield from this source adds considerably to the month's bullion.

Sulphur, the matte-forming element, comes from the zinc sulphate ($ZnSO_4$) remaining with the precipitate after acid treatment. The amount of $ZnSO_4$ present will depend, of course, upon the number of water-washes used in the final acid treatment. The more the precipitate is washed, the less will be the matte formed on a gold button. I believe that in our case (treatment of concentrate) it is possible at times for extremely fine material to escape from the filters, to be carried in suspension to the zinc-boxes where it is bound to remain with the other precipitate. The amount, however, is exceedingly small. If such be the case after treatment with acid, ferrous sulphate ($FeSO_4$) will be contained in solution, while free sulphur separates out with the precipitate according to the reaction:

$$FeS_2 + H_2SO_4 = FeSO_4 + H_2S + S$$

There is a possibility then, unless a complete roast is given to the acid-treated precipitate, of sulphur being present as a matte-forming material upon melting the final precipitate. The amount of sulphur obtained from this source to form matte will in all probability be slight. Experiments now point to the fact that the amount of matte obtained on a gold button depends principally upon two things, namely, the completeness of the final water-washes after acid treatment and the extent to which the final roast has been carried (whether merely a drying of the precipitate or a complete roast).

The matte that I am treating contains zinc, lead, iron, gold, and silver. When using the zinc-lead couple for precipitation, the presence of lead in the matte, if the gold slime is acid-treated and then smelted in a graphite pot, is practically inevitable. Lead in the matte may also be due partly to the dissolving (by the cyanide solution) of lead salts from oxidized concentrate followed by the precipitation of lead on the zinc. It may originate from the lead acetate used in some solutions. There are two sources by which iron may enter the matte, either by iron pyrite collecting in the zinc-boxes and finally appearing in the acid-treated precipitate as $FeSO_4$, or by some iron scale gathered from the roasting-pan with the gold precipitate. Zinc seems to enter the matte in considerable amount, especially when the acid-treated slime contains some undissolved zinc or has been only partly roasted, so as to contain zinc sulphate.

I believe that a small amount of matte on a button is desirable, for the slag above will, as a general rule, assay less in silver, especially when the matte contains lead. No nitre is used by us to keep down the matte upon fusion of the slime in crucibles. Its damage to the pots amounts to more than the cost of treatment of the additional matte. Previously to using my present method of reduction, we certainly did not welcome the presence of any considerable amount of matte at a clean-up, since the old method of treating small quantities with nitre or scrap iron was slow and incomplete. It is not safe to allow any amount of this rich matte to accumulate (it assays about $20 per lb.) and for that reason the best plan is to treat it immediately at the end of the clean-up, melting the bullion with the gold buttons into bars.

Potassium cyanide acts as a powerful reducing and desulphurizing flux, and for this reason it was used for decomposing the matte. Our particular matte is unusually high-grade, assaying as much as $45,000 per ton. It contains zinc, lead, and iron as sulphides, besides the precious metals. At the monthly clean-up about 800 lb. precipitate is obtained, producing nearly 3,000 oz. bullion, and from the treatment of this we obtain from 30 to 40 lb. matte. The amount varies from month to month. The method of treatment for the matte is as follows:

The matte, borax, and cyanide are put separately through a small rock-breaker and crushed fine. Borax and cyanide are used as fluxes and are put with the matte into three No. 60 graphite pots in the following proportions and order: There are alternate layers of borax, matte, and cyanide throughout, until the pot is full, and finally covered with borax. The crucibles are now put into the furnace and a white heat maintained for two or three hours. As a rule, it takes a little over two hours with a good hot furnace. It can be seen when the action is complete, for the charge will subside and the bubbling cease. The action and burning of the sulphur will be violent at the end of the first hour. Also the slag will become quite thick when the action is complete, being removed with a skimmer; this is necessary before pouring the contents of the crucible into a conical mold. If an excess of cyanide be used, it will be found just above the gold button and can be broken off by a blow with a hammer. The matte will now be entirely decomposed, leaving only a light porous slag and the gold button.

This method shows an extraction of 85 to 94% of the total value of the original matte, depending upon the richness of the material treated.

The Prospector.

Enquiries sent to this department are answered free of charge, if submitted by subscribers who are not in arrears. The full name and post-office address of the sender must be given, otherwise no answer will be made. Those who are not subscribers must accompany their questions with a fee of $3 for each question. No assays are made.

A specimen of Schist was sent by J. F. S., of Crackerjack, California.

The rock sent by O. H. F. H., of Bodfish, Cal., is a Sillimanite Schist.

The black sand sent from Cedarville, Cal., is specular Hematite, with some Magnetite. It would have no value as a placer deposit.

O. B. A., of Tenabo, Nev., sends: No. 1, Calcite; No. 2, Dacite, stained with Copper; No. 3, banded Opal, stained with Copper; No. 4, Turquois; No. 5, Chlorite and Epidote; No. 6, Pyrite, Sphalerite, Quartz, and Stibnite.

The specimens marked P., Mina, Nev., are: No. 1, Slate; No. 2, Epidote; No. 3, Quartzite; No. 4, Quartz-Porphyry; No. 5, Sandstone, No. 6, Rhyolite; No. 7, weathered Andesite; No. 8, Andesite; No. 9, black Quartzite.

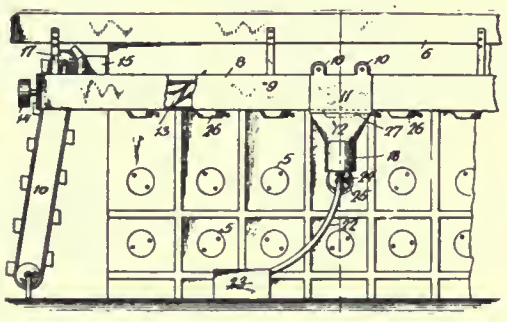
A. B., of Medical Springs, Colo., sends: No. 1, weathered Granite; No. 2, Epidote and Quartz stained with Limonite; No. 3, Diorite-Porphyry; No. 4, Feldspar-Porphyry; No. 5, Pegmatite-Granite; No. 6, crystalline Limestone.

B. R., of Hawthorne, Nev., sends: No. 1, Granite, with black speckled Hornblende; No. 2, Granite-Gneiss; No. 3, Barite and Quartz, stained with Malachite and Azurite; No. 4, Aplite Granite; No. 5, Chrysocolla; No. 6, altered Diorite; No. 7, impure Limestone.

MINING AND METALLURGICAL PATENTS.

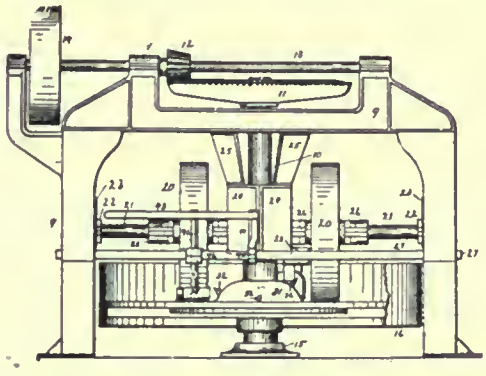
Specially Reported for the MINING AND SCIENTIFIC PRESS.

PROCESS OF FILLING ZINC-RETORTS.— No. 851,668; John D. James, Pulaski, Virginia.



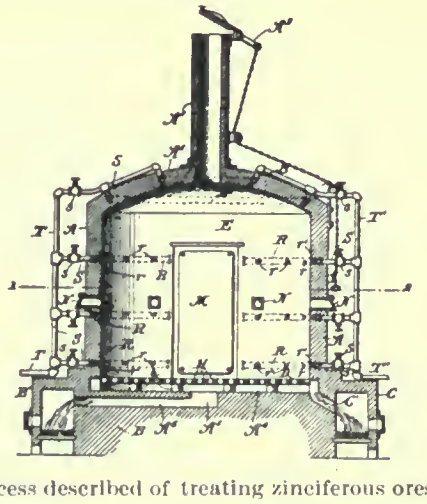
The process of packing or filling retorts, which comprises causing a jet of fluid to be directed into the retort longitudinally thereof, introducing into the said jet a constant supply of the material to be treated, said jet being of such force as to pack said material firmly and evenly within the whole cross section of said retort.

DRY-PAN CRUSHER.—No. 852,160; Jacob W. Boltz, Topeka, Kansas.



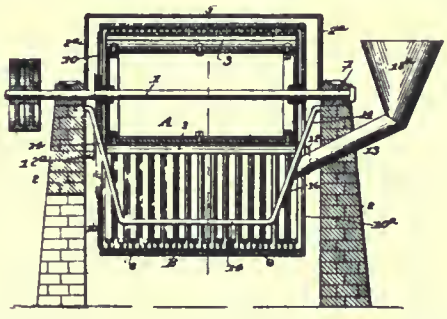
The combination of a frame, a vertical central shaft, a circular pan secured to the shaft and having an outer grated portion, a wearing-board, and a conical hub, mullers mounted loosely on the wearing-board to crush the clay, and plows to force the clay onto the wearing-board and under the mullers; with projections from the conical hub; and a toothed implement resting on the grated portion and diagonally disposed so as to push the larger lumps toward the wearing-board.

PROCESS OF PRODUCING ZINC SULPHATE DIRECTLY FROM THE ORE.—No. 851,639; George O. Angell, Philadelphia, Pennsylvania.



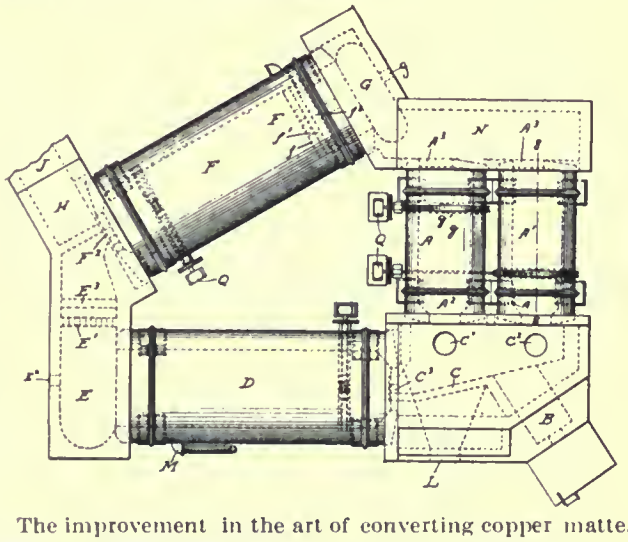
The process described of treating zinciferous ores containing sulphides of those metals, to convert and recover their constituent zinc and copper sulphides as soluble sulphates, direct from the ore, which consists in subjecting the ore, in a substantially closed chamber, to the action of burning sulphur oxides liberated, under the action of a preliminary roasting heat in the same chamber, from the constituent ore sulphides present, in the presence of free oxygen derived from air admitted to said chamber.

ORE-MILL.—No. 851,757; Julius Johnson, Mesa, Arizona.



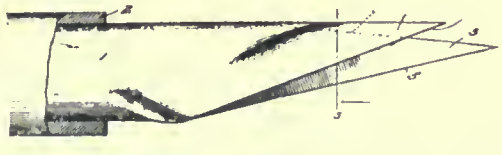
The improved ore-mill formed of a horizontal cylinder having its peripheral grinding portion formed of a series of bars extending transversely and parallel, and an inclosing drum resting, and its weight entirely supported upon, such cylinder, so that it constitutes the ore-crushing medium, said drum having its grinding surface formed of a series of bars extending circumferentially parallel and thus in planes perpendicular to the bars of the cylinder.

ART OF CONVERTING METALS.— No. 851,816; Richard L. Lloyd, Cananea, Mexico.



The improvement in the art of converting copper matte, which consists in feeding molten matte and flux into a converter, blowing the melt until copper sulphide is formed, removing the copper sulphide and adding matte until the slag becomes substantially neutral, removing the slag and feeding additional flux or slag unsatisfied as to bases, and so on continuously.

PICK FOR MINING OR CUTTING MACHINES.— No. 851,970; Thomas N. Wallace, Centerville, Iowa, assignor of fifteen one-hundredths to John R. Needham, Centerville, Iowa.



A pick for mining or cutting machines, comprising a stem, a central and side-points integral with said stem, the central point of greater length than said side-points, said side-points positioned in the same horizontal plane, the central-point positioned in a different horizontal plane from said side-points, said side and central-points provided with a longitudinally extending groove formed upon one side thereof, and upon their opposite sides said points taper to longitudinally extending cutting edges.

Publications Received.

NEW ZEALAND GEOLOGICAL SURVEY. 'The Geology of the Alexandra Sheet' in Central Otago. By James Park. This is an important bulletin by the director of the Otago School of Mines and deals with a large area of gold-bearing schist.

SOME RELATIONS OF PALEOGRAPHY TO ORE DEPOSITION IN THE MISSISSIPPI VALLEY, by H. Foster Bain. A reprint of a paper read at the Mexican meeting of the Tenth International Geological Congress. The Economic Geology Publishing Company.

THE DEPARTMENT OF COMMERCE AND LABOR, bureau of the census, has issued Bulletin No. 65, on 'Census of Manufactures, 1905; Coke,' preparad by Charles E. Munroe, under the direction of William M. Steuart, and which includes a map showing the situation of all coke plants in the United States, and descriptions of various processes of making coke.

Commercial Paragraphs.

HENRY F. JURS has severed his connection with the Power & Mining Machinery Co. to become local manager for the Mine & Smelter Supply Co., at Denver.

CLARK GROVE, who has been with the Mine & Smelter Supply Co. at Denver for a number of years, has been promoted to secretary of the company at 42 Broadway, New York, A. E. Loizeau, the former secretary, having been made auditor.

THE MORSE BROS. M. & S. Co., of Denver, report the following recent sales: A 100-ton concentrating plant for the Jessie Mines Co., at Chaparral, Arizona, in which will be installed three No. 3 Wild mills; F. W. Hearne & Co., Central City, Colo., one No. 3 Wild mill; the La Belle G. M. Co., Alma, Colo., complete 10-stamp mill with power; the Balkan Mining Co., Rochford, S. D., complete 5-stamp mill with power, and tables; and the Bear Top Mining Co., Murray, Idaho, one Franklin compound steam two-stage air-compressor, of 690 cu. ft. capacity.

MAX F. ABBÉ, inventor of the well kown Abbé tube-mill, sailed on April 30 on the steamer *Deutschland* for his regular annual trip abroad. Mr. Abbé will spend from five to six months in England and on the continent, and will visit London, Paris, Antwerp, and Berlin. The increasing popularity of the Abbé tube-mills has resulted in arrangements being made with Sutcliffe, Speakman & Co., of Leigh, Lancashire, to manufacture the various types, including the patented spiral feed and discharge tube-mill, for use in European countries, and Mr. Abbé will visit the works at Leigh while in England.

THE ABNER DOBLE COMPANY, engineers of San Francisci, have appointed Mitsui & Co. to act as their sole agents in Japan and its territories, Korea, China, and Manchuria, for the sale of Doble tangential water-wheels and hydraulic apparatus. The industrial development that is now taking place in the Orient, and the increasing demand for high-grade water-wheel machinery will make this co-operative arrangement an advantageous one for both parties. Mitsui & Co. is the largest and most progressive engineering house in the Far East and with its 35 branch offices is in a particularly good position to handle the water-wheel products of the Abner Doble Company.

THE INDIANAPOLIS SWITCH & FROG CO., of Springfield, Ohio, suffered from a fire on April 23, the main building of the machine shop being entirely destroyed, except the walls. This building was 400 by 225 ft., and will be rebuilt at once as a fire-proof structure. There was practically no loss of material or work in course of erection, and temporary arrangements are being made to complete, as far as possible, unfinished orders. At the earliest possible date this company will resume operations on a larger scale than before, restoring such equipment as was not seriously damaged, and replacing and adding such new machinery and facilities as are necessary for the equipment of a modern up-to-date plant.

THE JOHN A. TRAYLOR MACHINERY CO. has been awarded the contract for designing, furnishing all machinery for, and erecting a modern tungsten concentrating plant on the Rogers tract in Boulder county, Colorado, for Philip Bauer & Co., of New York and Hamburg. The ore will first be crushed on two No. 4 Traylor fine crushers to pass ¾-in. opening. The product between 30 mesh and ¾ in. will be jigged on the Traylor standard all-iron jigs. The tailing from these jigs will be re-ground on an Elspass triplex roll to pass 20 mesh. This product will be screened on five Imperial ore-screens, being successively treated on four Wilfley tables and two Traylor improved Frue vanners. The smaller product will first go to a Traylor slime-settling vat, and be drawn off to the two vanners. This plant will be in operation the latter part of June, sixty days from date of contract.

Catalogues Received.

A NEAT descriptive catalogue of the Ward Bros. Drill-Maker and Sharpener has been issued by the San Francisco office of the company. It contains a list of the companies using this machine, which includes many large producers.

THE DETROIT LEATHER SPECIALTY CO. Inc. of Detroit, Michigan, has issued a well gotten-up catalogue, devoted to the Wear Well leather packings, for hydraulic and compressed air, and all other machinery wherein leather packings are used.

THE COLORADO IRON WORKS CO., of Denver, Colorado, has published Catalogue No. 7-E, on 'Concentration Mills and Machinery.' This is an attractive catalogue of 100 pages, containing useful information regarding the treatment of ores by concentration.

THE FULTON IRON WORKS, of San Francisco, Cal., is just sending out a handsome catalogue, No. 106, of 94 pages, entitled 'Gold and Silver Milling.' The publication is beautifully illustrated with cuts of everything in the machinery line necessary for gold and silver milling, and amalgamating and concentrating.

THE KEYSTONE DRILLER CO., of Beaver Falls, Pa., has just published catalogue No. 2, describing the mineral-prospecting and placer-testing machines made by the firm. The publication is a large, beautifully illustrated folio, and contains some interesting information, including articles on prospecting and valuing dredging ground by wellknown dredger-men.

Trade Treatises.

THE ALLIS-CHALMERS CO., of Milwaukee, Wis., sends us Bulletin No. 1,421, describing the Overstrom table for concentrating ores, and detailing its list of advantages.

THE STEPHENS-ADAMSON MFG. CO. has issued pamphlet No. 2, 'Conveying and Transmission,' describing the belt-conveyors and elevating machinery made by this company.

THE JOSEPH DIXON CRUCIBLE CO., of Jersey City, has issued a booklet, 'A Study in Graphite,' which gives in detail a series of tests of graphite made by Prof. W. F. M. Goss.

THE ROBINS CONVEYING BELT CO., of 13 Park Row, New York, has just issued an interesting four-page leaflet describing the installation of a package conveyor system in the new store of B. Altman & Co., Fifth Ave., New York.

THE INDESTRUCTIBLE FIBRE CO., Wendell & MacDuffie, 26 Cortlandt St., New York, sole selling agents, has just issued a four-page pamphlet describing their materials for car head-linings and marine work. There are three grades of fibre board made up in various qualities for this class of work, and are sold under the trade names of Durite, Fibrite, and Kantlite.

Editorial.

WATER IN NEVADA has a value unknown in mining regions where gold is less plentiful. The article by Mr. Henry Thurtell, State Engineer of Nevada, gives a comprehensive account of the resources of the State in respect of water for agricultural and mining purposes. It is not on Wall Street alone that they turn water into golden wine.

BY THE WITHDRAWAL of the Spreckels steamers from service between San Francisco and Sydney, we have lost a useful commercial link with Australia. While the Oceanic Steamship Co. was never up-to-date, it was better than nothing; therefore we are glad to hear that a new line is likely to commence sailings in August. This new service will be operated under the name of the Australian Mail; Andrew Weir of London and Frank Waterhouse of Seattle are the responsible parties.

WE HAVE AVOIDED saying anything concerning the trouble between the dredging companies and the farmers, simply because any comment was calculated to aggravate the misunderstanding between two important local industries. It appears that the leaders of the Anti-Debris Association have shown a good deal of sense, and they have met with a reasonable spirit from the men directing the dredges at Oroville and Folsom. Every effort is being made to minimize injury due to mining operations, and the farmers are becoming aware that their interests are being properly considered. Therefore we expect to see matters adjusted without the litigation that would be so injurious to all concerned.

ROMANCE IN MINING is so often of a fictitious kind that a true story, with the element of the picturesque, is always welcome. The facts connected with the discovery of the famous Lluvia de Oro district, in Mexico, are related by Mr. R. H. Burrows on another page, and they would easily lend themselves to the skilled hand of such novelists as Mary Hallock Foote, Frank Nason, or Rolfe Bolderwood. Apart from this particular incident in the history of the district, Mr. Burrows gives a description of the ore deposits and their connection with the great fault that forms a magnificent scarp in the local topography. Even that extraordinary geological cleft might be made a feature in a romantic tale, beginning with the successful search of the heroic prospector and culminating in the plunge of the villain from the summit of that beetling cliff. The two main incidents might be filled out with a few *serapes* and *mantillas*, a description of an *arrastre* in operation, the repulse of a band of Yaqui Indians, a boom in the stock on Wall Street, a wild ride up the *arroyo* of Bahuerachic, and so forth. Here are materials for a novel to surpass

Tom Lawson's fervid rot as published recently under the title of 'Friday, the 13th.'

IT IS A PLEASURE to note the rapid growth of the business done by the United States Smelting, Mining & Refining Company, whose annual report has been issued recently. The properties are valued at $35,685,958, and the gross earnings for last year amounted to $15,149,574, giving a net balance for dividends of $3,504,522. We congratulate Mr. A. F. Holden and his associates, and trust that their operations will continue to be successful; for we take the position, frankly, that it is a good thing to have competition. The American Smelting & Refining Company, that is, the organization dominated by the Guggenheim family, is also doing well, and we hope it may continue to prosper. We pray that the mining industry may be delivered from the domination of any one company, however able or honorable. Healthy progress will be fostered by reasonable competition.

UNDER CONCENTRATES we publish replies to questions, in the belief that the problems confronting one man are likely to face another and that the effort to solve them will be of interest to many. Among other matters we are enabled, by the aid of advice given gratuitously by friends of this journal, to reply to matters beyond the knowledge of the editor. But it must be recognized that the privileges offered by the department known as 'Concentrates' must not be abused, that is, readers should abstain from asking for the advice that ought to be obtained from a professional man and paid for in the proper way. One condition of such inquiries we cannot accept, and that is the request that they be answered privately. Thus this week we get a letter from the propounder of a question asking that we refrain from publishing it, also to send him the answer privately. We decline to be used as a bureau of private professional advice. 'Concentrates' is a medium of presenting interesting information to an intelligent community, it is not private legal advisor 'in ordinary' to individuals in distress.

COMPLAINT IS OFTEN MADE over the delay in the publication of special reports by the United States Geological Survey. The results of geological investigation seem to be issued a preposterously long time after the field-work has been completed. The bulletin on the Down-Town district of Leadville is one of those long awaited by the mining community, in fact, the two houses of the last Colorado legislature passed a joint memorial asking the Director of the Survey to expedite the publication of this bulletin. Most people have but a scanty idea of the amount of labor involved in the correlation of data and the preparation of accurate maps, but even when all this is done there begins another stage, the protracted length of which is due mainly to those departmental methods symbolized by red tape. Under the law, everything in the way of maps and illustrations, except those of the folios, has to be submitted to competitive bidding before a contract can be let for engraving and printing. The Public Printer gives the engraving firms a number of weeks in which to prepare bids, and then, after the bids have been examined carefully, the successful bidder gets a further generous allowance of time wherein to complete the work. In the case of the Leadville bulletin, the text has been ready for several weeks and awaits the delivery of the engravings for illustration. If this last portion of the mechanical work were done by the Survey, as the folios are done, there would be a great saving of time and the expense would be no more, possibly less. It is hoped that the new director, Mr. George Otis Smith, a man of approved business ability, will be able to cut some of this red tape and expedite the issue of the valuable literature published by the Survey. We are informed that he has made special efforts to hasten the appearance of the Leadville bulletin mentioned above, and the Public Printer has assisted him by awarding the contract for the lithograph maps to the bidder specifying the shortest time limit, although his bid happened to be the highest submitted.

The Plight of the City.

CIVILIZATION is an orderly condition of living, based upon the organization of the community. At the present time San Francisco affords the spectacle of a complex civilization that has broken down by reason of the unwillingness of a portion of the community to observe the laws, written and unwritten, upon which social order is founded. With an indicted fiddler at the head of the municipality, with an industrial vendetta between the car company and its employees, headed on the one hand by callous financiers and on the other by irresponsible agitators, with a police force that gives its sympathy to one side and a public that suffers from both, we have so complete a collapse of the art of living in an orderly manner that the stranger within our gates would be warranted in asking if we are not tending to a condition of fixed disorder, that is, anarchy. For anarchy does not require cossacks and bomb-throwing, any more than it needs an imbecile czar and down-trodden serfs; anarchy is a chaotic condition of society, marked by the contempt for law and the absence of government. To that pass we have nearly come. And yet not quite. There are signs of an awakening, there is a leaven of good citizenship at work in this community, and there is evidence that out of the turbid stream of events there will crystallize a public opinion strong enough to support those who have civic spirit and are willing to translate that spirit into action. To the world at large San Francisco today stands dishonored by her municipal officers, corrupted by service corporations, and enfeebled by a puerile press. In an extreme measure she is the victim of forces created by an industrial civilization that is dominated by the universal haste to make money without regard to morality. The splendid energy of the individual and the wonderful resources of the region in which he lives, have served as yet mainly to turn the citizen into an island of selfish energy in the sea of circumstance; the pressure to go ahead is so great that the direction of progress is overlooked. San Fran-

cisco is the arena in which is being waged the great battle of a brutal industrialism against a restraining civilization, what is worst and what is best in human progress are here in vivid contrast, and if our city is the scene of a sordid drama, it is mainly because here the two extremes of modern advancement have been most developed. Nevertheless, we have no fear of the outcome, for we believe in the power of thoughtful men once aroused to their duty, and in the development, through experience, of popular government.

The San Francisco Smelter.

OUR READERS are aware, from the accounts we have published from time to time, that a large smelter is being built at San Bruno, on the outskirts of San Francisco. This plant is intended for the treatment of copper ores, and the silicious material incidental thereto. In our issue of April 20, 1907, and in that of April 14, 1906, we gave such information as the mining community would be likely to want on this subject. We welcomed the enterprise as one designed to be beneficial to this City and to the mining regions tributary to it. But it appears that there are those to whom a smelter is an anathema, to them it is a foul instrument of New York capitalists careless of our lovely scenery, and reckless of injury to our balmy air. It is not necessary for us to protest our freedom from bias of a common sort, for the MINING AND SCIENTIFIC PRESS is no more beholden to the Guggenheims than it is to the King of the Belgians, and we are as free to criticize the methods of the smelter consolidation as we are to discuss the origin of ore deposits. No more need be said on that score, and less might have been said save for the attacks made in the local press against this smelting establishment at San Bruno. Recently an article on the subject appeared in the Oakland *Tribune*, but the opinion of so disreputable a newspaper carried no weight, and it was not until the *Argonaut* entered the lists that it seemed worth while to contradict the fallacies of the untechnical press. We regret the attitude of our friend the *Argonaut*, for it is evident that it has been supplied with misleading data, and that it has unwittingly lent its character for honorable purpose to the furtherance of misunderstanding. In its issue of May 18 there appears an editorial entitled Another Menace.' This is full of errors. In the first place the capacity of the smelter is not 5,000 tons of copper ore per day, but 1,100 tons of charge, of which 700 tons will be copper ore. These ores "are said to contain" from 15 to 40 per cent of sulphur, and from a trace to 10 per cent arsenic. It is possible to learn just what they do contain, namely, the ore will contain 36 and the matte 20 per cent sulphur, and from nothing to 0.02 per cent arsenic. The supply of copper ore will be derived from the Dairy Farm mine in Placer county, the Trinity and Balaklala mines in Shasta county, while the silicious ore will come from Nevada.

The *Argonaut* states that the smelter will discharge 1,250,000,000 cubic feet of fume in 24 hours, estimated to contain 1,500 tons of sulphur dioxide, with possibly 20 tons of arsenic. These figures are likely to overwhelm a polo player at Burlingame, or a gentleman of leisure at San Mateo, but they are wildly incorrect. The smelter will discharge scarcely one-seventh the amount of fume stated, containing not 1,500 tons of sulphur dioxide, but 100, and not 20 tons of arsenic, but 100 pounds at the most. Of the total ore smelted in one day, 300 tons may contain some arsenic, the maximum total content being 1,000 pounds per day, not one-tenth of which will escape out of the stack, becoming deposited in the flues.

But there is another argument brought forward, namely, that it will be easier to deal with the matter now, than when the smelter people have vested rights on their side. The law is as faulty as the metallurgy. Smelting is not a nuisance *per se*, it is the manner of conducting it that may make it so; no company can get a vested right to operate a smelter in a manner injurious to the neighboring community unless that community permits the operation to continue for a term of years. To talk of stopping the construction of the smelter is false education of the public, for it is not legally possible. When the smelter is built, and when the fume from it is found to be injurious to life or property, then it will be possible to take legal measures for the purpose of ending the nuisance. In the meanwhile we may well leave it to the good sense of the community to decide whether such clever operators as the Guggenheims would invest two million dollars in a plant subject to immediate restraint; is it not reasonable to suppose (as we have explained on a former occasion) that they have obtained the best metallurgical advice with a view to doing no injury to the surrounding country? To non-technical people the percentages of sulphur, the cubic feet of fume, and the other scientific details do not mean much, but we venture to present one fact that requires no scientific training to be appreciated; and it is this, that New York is one of the most important metallurgical centres in the world. There are five large smelting plants in continuous operation within the outskirts of New York, and nearer to the heart of that city than San Bruno is to San Francisco or San Mateo. Most of these plants treat matte containing about 20 per cent of sulphur, and the injury is nil, simply because proper precautions have been taken. The trouble in Montana and Utah has been due either to the carelessness of the smelter people or blackmail from the ranchmen. If proper care is taken to prevent injury to life and property, and if the surrounding community is not rapacious, the smelters do their useful work without remark—as in New York, as at Tacoma, and as at Denver. For a large part of 15 years the present writer lived at Denver, within three or four miles of three large smelting plants, yet no one ever suffered, nor did the vegetation. A slight whiff of sulphur once in a while served as a reminder of an industry that benefited the whole community and was as necessary to the development of the resources of the country as the smoke of a locomotive or the whistle of a steamboat.

Personal.

J. H. MACKENZIE is in Arizona.

J. W. MERCER is in San Francisco.

JAMES D. HAGUE is here from New York.

ALBERT BURCH is at Lead City, South Dakota.

GEORGE W. MAYNARD is at White Horse, Alaska.

MARK R. LAMB is at Woods Hotel, in Mexico City.

DON MAGUIRE, of Ogden, Utah, was at Chicazo lately.

R. GILMAN BROWN has returned to London from Chile.

MARTIN J. HELLER is making a brief stay in San Francisco.

CLIFFORD G. DENNIS, of Terlingua, Texas, is on a visit to San Francisco.

WILLIAM R. FAITHFUL is on his way from London to southern Siberia.

GORDON LAND has left Oroville, and is now at Victoria, British Columbia.

H. S. MUNROE and JOHN J. ROBERTSON sail for Valparaiso on May 25.

E. H. NUTTER, superintendent of the Liberty Bell mill, waa in San Francisco this week.

ROBERT T. WHITE, of the Balaklala Copper Co., has been on a visit to Salt Lake City.

W. E. THORNE is now at East Auburn, Cal. He is field assistant to the State Mineralogist.

DAVID MCCLURE was in the City this week, on a visit from the Gwin mine, Calaveras county.

F. L. BOSQUI is at Tonopah, as consulting metallurgical engineer to the Montana-Tonopah Mining Company.

THOS. H. LEGGETT has returned to London from Russia. He expects to go there again before coming to California.

CHARLES JANIN, of Janin & Smith, is in western Chihuahua, Mexico. He expects to go from there to Denver.

F. S. SHEWELL, of Guanajuato, Mexico, was slightly injured in a wreck on the Burlington road near Chicago on May 9.

PERCY M. NEWHALL, engineer to the Witwatersrand Deep mine has returned from Johannesburg on a visit to Oakland, California.

GERALD LOVELL, lately manager of the Great Fingall mine, passed through San Francisco on his way from Australia to Denver, on a vacation.

C. M. FUELLER is engaged in professional work near Wickenburg, Ariz.; he will visit Los Angeles and San Francisco before returning to Denver.

ARTHUR W. JENKS passed through San Francisco last week on his way to Portland, Oregon, where he will open a permanent office at 242 Washington street.

LAZZARD KAHN of Hamilton, Ohio, has resigned as director of the Daly West Mining Co., and has been succeeded by HENRY G. MCMILLAN of Salt Lake City.

W. E. DEFTY has resigned as consulting engineer to the Mina Juarez Co., Sonora, Mexico, and has no further connection with the company in any capacity whatever.

A. A. HASSAN has left New York to examine the new discoveries at Larder lake and Lady Evelyn lake, near Cobalt, Ontario. From there he will go to Nevada City.

GEORGE SYDNEY BINCKLEY, late chief engineer and manager of construction for the Monterey Water Works & Sewer Co. and the Monterey Railway Light & Power Co. at Monterey, N. L., Mexico, has accepted the position of manager of the mining properties and smelter of the Douglas Copper Co. in the State of Sonora, Mexico.

W. Z. KINNEY, Silverton; A. G. BROWNLEE, Idaho Springs; R. L. MARTIN, Central City; GEORGE E. COLLINS, Denver; and T. J. DALZELL, Cripple Creek, compose the executive committee of the Colorado Mine Operators' Association, with permanent headquarters in the Boston Bdg., Denver. JUDGE E. A. COLBURN is president and W E. PASSMORE, secretary of the Association.

General Mining News.

ARIZONA.

COCHISE COUNTY.

A strike of three feet of ore, averaging 14% copper, is reported from the property of the North Bisbee Dev. Co. This company owns 20 claims about three miles northwest of Bisbee. The shaft is down 25 ft., and a tunnel has been driven 240 ft. H. S. Jones is president and E. H. Clark treasurer.

GILA COUNTY.

Globe is a busy camp, and it is estimated that there are more than 4,000 men on the payroll there, which is more than there were employed in Bisbee before the strike. The Phelps-Dodge company alone employs 2,800 men, 2,200 being at the Old Dominion and 600 at the United Globe.

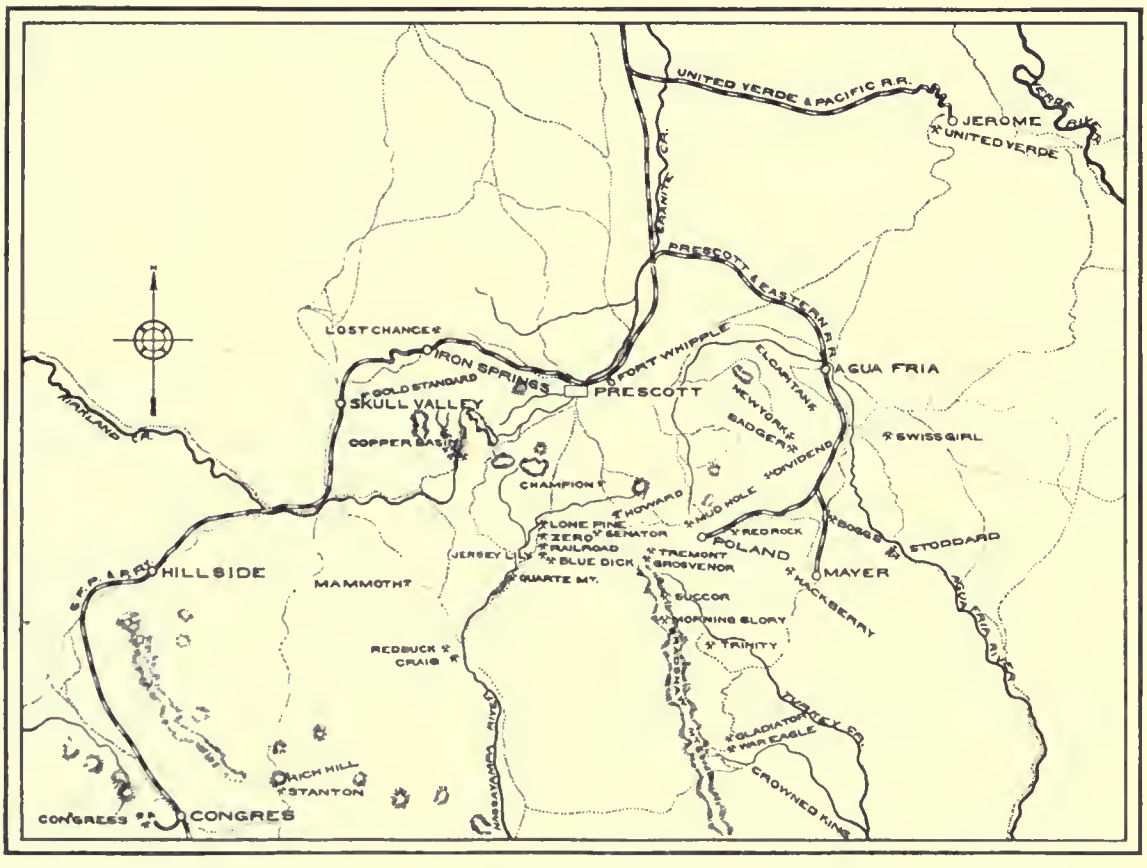
E. A. Wayne has resigned the superintendency of the Globe Consolidated company, and has gone to Silver City, New Mexico, to be manager of the Copper Gulf Development Co. His successor is Adolphus Baill, who was superintendent of the Utah Consolidated company.——A vein has been encountered in the north cross-cut from the Gem shaft of the Globe Con. property, about 300 ft. from the shaft.——The directors of the Old Dominion Mining Co. of New Jersey have voted to sell 12,000 shares of stock to shareholders, pro rata, at $50 per share. The Maine company owns all the stock of the New Jersey company, except about 6,000 shares. The stock will be underwritten without commission.

GRAHAM COUNTY.

The Lone Star Con. Co. has purchased the Iron King claim, adjoining the original Lone Star group. This company now owns 69 claims. A 50-ft. inclined shaft has been sunk on the Iron King, and copper sulphides have been encountered. The shaft on the Lone Star claim is down 330 ft. and is going down at the rate of 60 ft. per month.——A good vein has been opened in the San Juan claim, and at a depth of 245 ft. it is still widening.——The output of the Arizona Copper Co. for April was 1,316 tons of bessemer copper.——The output of the Shannon company for April was 627 tons of bessemer copper, a slight decrease from the preceding month. When the new railroad is built, this company will be in a position to handle more ore.

MOHAVE COUNTY.

Good results are reported in the cyanide mill of the Yucca Cyanide M. & M. Co. at Cedar. Lumber and machinery are being hauled to Victor, south of Goldroad.——A number of directors of the Benedictine mining company have recently visited the property at Cedar. Over 60 men are employed at the mine and mill.——The working force will be increased at the Techaticup and Wall Street mines, owned by Joseph Wharton, at Eldorado cañon.——John Boyle Jr., the manager of the Cerbat Mtn. property at Cerbat, reports that some rich ore has been struck in the winze from the 175-ft. level of the Vanderbilt mine. Connection is to be made through this winze with the 300-ft. level.——



Map of a Part of Arizona.

A. N. Rice, of Boston, has been examining the Planet mines. The diamond-drills proved valueless for prospecting and the property will be opened by a shaft. It is understood that a branch railroad will be constructed to the mines, along Bill Williams Fork, from the Arizona & California main line.

PINAL COUNTY.

(Special Correspondence).—The present smelter of the Saddle Mtn. Mining Co., at Christmas, consists of a furnace 36 by 122 in. with 11 ft. between floors. It will be raised to 18 ft. between floors, giving it a capacity of 300 tons per day instead of 200 tons, as now used. A new furnace will be added, 44 by 200 in., 18 ft. between floors, with a daily capacity of 500 tons, or a total for the plant of 800 tons per day. Both furnaces were built by the Colorado Iron Works. The new plant is ordered for this month's delivery, and there will be all the usual equipment of blowers, boilers, engines, dynamos, and electrical apparatus. The smelter is supplied by ore at the present time from three shafts, the Hackberry, 200 ft. deep; the No. 1, 400 ft. deep; and the No. 2, 200 ft. deep, besides the surface workings at Copper Knob and on Christmas hill, where a large tonnage is quarried. Part of the increased tonnage will come from two new shafts, the No. 3 and the Christmas, each of three compartments, 4 by 5 ft. in the clear. These two shafts will

eventually handle the greater part of the ore except from the Christmas and Copper Knob districts. The ore from No. 1 and 3 shafts will be handled as at present, by gravity trams, and from the Hackberry, Christmas, and No. 2, by electric trams. Good showings are found in the No. 1 shaft on the 120 and 300-ft. levels. The orebody on the 120-ft. level is a blanket formation. The ore is proved for a length of 625 ft. and 300 ft. wide and averages six feet thick. On the 300-ft. level a body of ore has been opened 225 ft. long and 94 ft. wide, which is stoped to the height of 22 ft., and a winze sunk 70 ft. is still in good ore. The percentages of copper are higher on the lower level. The ore is low-grade, but the showings on the 400-ft. level are good. The body on the 400-ft. level is about 5% copper, while that on the 120-ft. level averages not quite 4%. The smelting proposition of the company is unique. The ore is self-fluxing and not a pound of barren flux is used and no ore from other properties has ever been used. The smelter charge of ore at present carries 3% copper and can be brought up to 3½%. The company has produced about 3,750,000 lb. of copper to date and is producing with its present equipment about 250,000 lb. per month. Last month's payroll carried 586 names. In addition to the 535 acres which make up the patented copper property, the company also owns a gold property of 260 acres, five miles from Christmas, which is developed and patented. The company also owns 800 acres of coal land on which a beehive coke oven has just been built, to test the coking qualities of the coal. The fuel value of the coal has already been determined, as it has been used successfully under the boilers. On the coal property is one inclined shaft 175 ft. deep, which has opened up two veins of coal, one three feet and the other two and one-half feet thick.—— Word has been received from George B. Chittenden of the Saddle Mtn. Co., that Edward D. South will succeed him as general manager for the company.

Phœnix, May 13.

YAVAPAI COUNTY.

(Special Correspondence).—The new shaft at the Mount Union Con. Mining Co.'s mine, in the Mt. Union district, is down 700 ft., and a good body of sulphide ore is being opened in the lower levels. The mill is idle on account of the scarcity of coal, but will be started as soon as a consignment ordered some time ago is delivered.—— C. K. Tibbetts, general manager for the Golden Idol Mining Co., was in Prescott this week and deposited a bar of gold bullion from the company's mill in the Cherry Creek district. The gold bar was the result of the second run of the new mill.—— In Jerome there is a general awakening of the mining industry. Within the past month the force on the Octave mine had been increased to over 80 men, and preparations are being made to resume work on the Leviathan and the Rincon properties.

Phœnix, May 18.

A new reduction plant has been purchased by the Jessie Mines Co., operating in the Chaparral district. The mill will have a capacity of 100 tons per day, and will be equipped with amalgamating, concentrating, and cyaniding machinery. The mine is about four miles west of Huron, on the Bradshaw Mtn. railroad, and includes a water-right on the Agua Fria river. The Little Jessie mine is opened by a shaft 660 ft. deep, and more than a mile of drifts and cross-cuts have been driven on the vein. The shaft will be sunk to the 1,000-ft. level.

CALIFORNIA.

AMADOR COUNTY.

A feeling of unrest has been created about Jackson, by the request for recognition of the Miners' Union. The operators have made no direct reply to the demand, as they wish to know of the scope and effect of the recognition wanted.

CALAVERAS COUNTY.

The strike situation remains unchanged. The Utica officials declare that they will not listen to the miners' proposition, as do also the Lightner and Angels superintendents. The business of the town is paralyzed by the cutting off of a monthly payroll of $50,000.

NEVADA COUNTY.

The Republic mine, in the Graniteville district, has been bonded to Nevada speculators for $50,000. The vein is an extension of the National, and two tunnels have been run, the upper one being 830 ft. long and the lower 300 ft. A five-stamp mill is on the ground, and another mortar will be added.——The Mine Owners' Association has sent its reply to the Grass Valley miners' union, in the matter of an increase of wages, but what the text of the response was, has not been given out. It is generally believed, however, that the operators have refused to grant the raise of 50c. per day for underground men.——The new 10-stamp mill at the Conlan will not be in operation until June 1, the delay being caused by the non-arrival of the cams. The raise from the 300-ft. level has nearly holed through, and will be of great use in ventilating the mine.——The Pennsylvania company will soon have the two new pumps in operation, which will increase the pumping capacity 1,200 gal. per min. The pumps were made by the Taylor Foundry company, and are of the Cornish type, to be operated by electricity.——The Iron Mountain mine, in the Spenceville district, has been purchased by C. L. Wilson, of E. A. Wiltsee of New York. It is thought that he has merely taken over Wiltsee's option, which was for a long period of time. During the past year a shaft has been sunk for 150 ft. and two drifts have been run. Sinking has commenced again, under the superintendency of William Torpie.——Copper ore is being shipped to the Kennett smelter from the property of the Omaha & California Mining Co., at Spenceville.

PLACER COUNTY.

Six lessees are working at the Red Point.——The Imperial company needs more men.——The Pioneer quartz mine, between Towle and Damascus, has been sold.——There is rich ore in sight at the Three Queens.——L. C. Trent is directing operations at the Iron mine. The old shaft has been pumped out and cross-cutting has started, 14 men being employed. William Dodge is the superintendent.—— M. Savage is prospecting the old Homestake on the west side of Volcano cañon. Rich ore has been taken from this property, but the ground is very heavy and hard to hold.

The Crater Hill company, which has taken hold of the St. Patrick mine, near Ophir, has ordered a pumping plant. The Hammon dredging interests are backing operations at Crater Hill. The old workings, with a 700-ft. shaft, will be pumped out, retimbered, and equipped with modern machinery.

SHASTA COUNTY.

The steel frame for the Balaklala smelter at Coram is nearly finished, and Gerrick & Gerrick, the contractors, are shipping their machinery back to Seattle.

SIERRA COUNTY.

The tunnel at the Herkimer gravel mine is in 900 ft., and is nearing the old Bunker Hill channel, from which much gold was taken in the early days. A new ditch has been completed, which furnishes plenty of water for power and other purposes.——The gravel channel has been tapped at the Lucky Dog mine at Forest, now under bond to H. L. Johnson.——A rich pocket of ore, yielding $3,200 from 300 lb. of ore, was recently struck at the Tightner mine at Alleghany. This shoot of ore has been tapped at a depth of 170 feet.

Oregon mining men are investigating the mining situation at Forest, including the Nelly Bly gravel mine on Oregon creek, three miles west of Forest. The channel is supposed to be the one worked on Rock creek, at the City of Six and at the Ruby mine.——The Monte Cristo mine on American hill is being investigated. This mine is said to have paid $500,000 in the 6,000 ft. of channel that was worked, and the syndicate now negotiating for the ground will develop a part of the property never before worked.——A wagon-road is being built to the Sovereign mine in Ladies gulch, which is being developed by San Francisco capitalists. A 10-stamp mill, operated by water-power, will be built.

SISKIYOU COUNTY.

It is expected that the bond on the Blue Ledge mine will be taken up when due, on July 8. It is proposed to build a

road from Grants Pass to the Blue Ledge mine, over the Siskiyou Mtn., down Seiad creek, through Happy Camp, thence to Eureka.——There is a force of men working at the Highland mine, on Salmon Mtn., about 18 miles southwest of Etna. The vein is two feet thick and carries some rich pockets. L. H. Cory is superintendent.——The Portugese ditch and the Phillips ditch, carrying water to Hawkinsville, are still supplying water for the placer mines at Rocky Gulch and vicinity. The Phillips ditch furnishes a good head for hydraulic operations, while the Portugese ditch carries water for sluicing purposes.

Miners are scarce in the Callahans and South Fork districts. About 45 men are working at the McKean quartz mine and 15 men at the Welsh placer mine, on Grouse creek.——The Los Angeles company, working on the Lew Doggett ranch at Klamath river above Oak Bar, is putting up a French elevator, a new-style dredger. A steam-engine does the hoisting and the buckets are dumped into sluices, the tailing running back into the river.——Richard Reiss has struck a seven-foot vein near the wire bridge at Hornbrook. The tunnel is 175 ft. long and a shaft is being sunk to connect with it.——S. J. Fore has bought the Stalcup's claim on Klamath river, and the old mill at Ash Creek, which he will tear down and rebuild at Dutch Gulch.——The Salmon River H. G. & D. Co. expects to carry on extensive operations at Peterburg, near Cecilville, in the Salmon River district, this summer.——Several quartz veins have recently been found in the Yellow Butte district at the head of Shasta valley.

COLORADO.

GUNNISON COUNTY.

The Utah Fuel Co. has given S. Gruber a contract to supply 50,000 props to the Somerset mine.——The Crested Butte Coal Co. will increase its output as soon as the new pit cars arrive. The company now employs 40 men and the gravity train is in good working order.

OURAY COUNTY.

At the Gold Lions mine, at Red Mtn., much interest is being shown in a Park automatic loading machine, which has recently been installed by the Railway Materials Co., of Chicago. The machine is operated by electric motors, and loads material into cars direct from the pile. It has materially cut the cost of labor, and 10 cars, holding 40 cu. ft. each, have been loaded in nine minutes, including switching and other delays.

The Gold Lion tunnel, near Ironton, is in over 900 ft. For the last 700 ft. the ground has been soft, requiring close timbering. As soon as good ground is cut, a cross-cut will be started for the Mountain Lion vein.

SAN JUAN COUNTY.

With the opening of the Silverton Northern railroad from Eureka to Animas Forks, the Gold Prince mill, managed by W. Z. Kinney, will treat 500 tons per day. The Mountain Queen, in which a good body of ore has been opened, will start shipping, as will also the Sunlight and the Bagley tunnel.——The Silver Lake mill is running.——The Iowa-Tiger, which has lain idle for many years, will start shipping this summer.—— Copper ore is being stoped at the Detroit & Colorado mine, which is managed by L. L. Haines.—— The new electric transformer will soon be in place on the Tom Moore property, and the force of men will be increased. S. G. Martin is the manager.

SAN MIGUEL COUNTY.

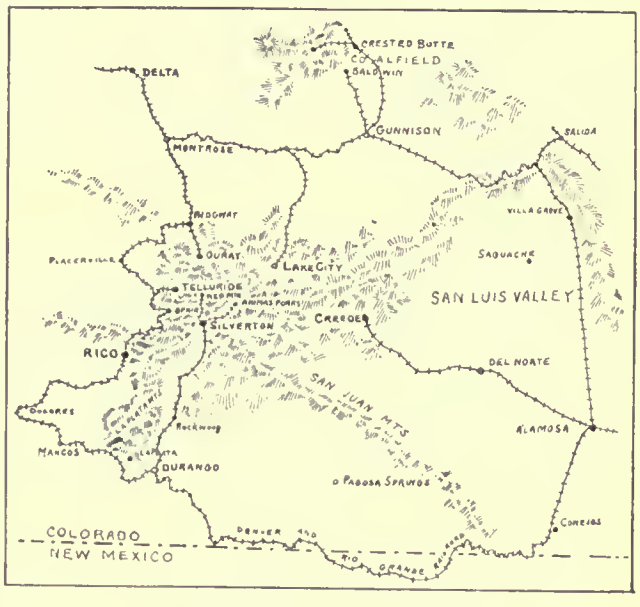
The Chicago men who recently purchased the Bradley and Pioneer mines, and the Cimarron group, in Marshall basin, are installing a new 250-h.p. electric motor to run a large air-compressor. The lower tunnel on the Bradley and Pioneer will be driven ahead, and development work will be done on the Cimarron. It is reported that the same people have an option on the Ophir tunnel, about 4,500 ft. long, which starts just above the Cimarron mine, and runs through the hill into Middle basin, intersecting the Montana vein.

SUMMIT COUNTY.

(Special Correspondence).—A deal has recently been consummated by G. Knutzen and associates of Berkeley, Cal., for the Eighty-six and Gold Dust properties, which comprise 120 acres on Nigger hill, about one mile from town. This property, especially the Gold Dust, has produced some high-grade material in the past, and is considered an excellent property. A large tonnage of mill dirt is reported in sight and it is the intention of the new owners to put the West Side mill, which they have secured, in first-class shape for handling the material from the mine. A three-compartment shaft will be sunk on the property and a hoisting engine suitable for the work will be installed. Most of the work has been done through an adit and winze, but the former owners did not have the capital to do the work necessary to make the mine pay. It is understood the parties now in control have plenty of money to put the mine on a paying basis.

Breckenridge, May 14.

(Special Correspondence).— Active operations proceed without cessation on the principal mines of this district, although this time of the year is bad for most of the properties, as the thaw is setting in, and the new snow falling at the same time causes a great flow of surface water. This is a great boon to the placer mining operations of the



Map of Southwestern Colorado.

camp, but is an endless source of trouble to the lode mining companies.—— The Germania property, on Little Mtn., is being worked by Adams & Adams, lessees, who are shipping high-grade silver-lead ore, carrying gold.—— The Cashier mine, which has produced well in the past and which has an equipment of modern milling machinery, is under consideration by Denver capitalists, who intend to merge with it the Three Kings property in the Swandyke district.—— The Sallie Barber mine, on Nigger hill, which produced some of the richest zinc ore in the county, has been unwatered preparatory to resuming sinking and driving on the veins. This mine will be one of the big producers this year.—— At the Wonderful London, the main shaft is down 570 ft., and the hoisting plant has been found inadequate to go down further. A new plant will be installed at once and the work of sinking continued. M. H. Howe is the superintendent.—— The Canyon Zinc Co. forfeited its contract on the Country Boy property by failure to pay royalties as agreed. The original owners of the Juniata Mining Co., of which the Country Boy is a part, have resumed control and will operate it themselves. This mine produces the highest grade zinc ore in Colorado.—— Mark G. Evans, of Denver, has obtained an option on the Washington mine, with right to operate it on royalty for a period of three years. By the agreement, work must be started on reconstruction of the mill by June 1.—— The Cornucopia Tunnel, M. & T. Co. is the name of a new incorporation registered by John C. Fry, N. M. Bass, and W. A. Blakiney for $2,000,000 to operate in Peru and Snake River districts.—— It has been decided to start a cross-cut

tunnel in French gulch, to be driven toward the main vein of the Helen group situated on Nigger hill. This property belongs to the Lennox Giddings Co., of Colorado Springs, and carries free-milling gold. If developments warrant it, a mill will be built on French creek.—— The main development tunnel of the French Creek mine is 3,000 ft. into Bald Mtn., and it is the intention of the owners to continue this work to cut the many veins which outcrop in that mountain.—— James T. Hogan, president of the Jessie Consolidated Mines Co., has returned from the East, where he made plans for the enlargement of the company's 40-stamp mill and plant. This is one of the most consistent producers in the district.——John G. Goodier announces that he intends to push work on the Abundance company's main tunnel, in Mineral hill.——The Swastika Gold M. Co. has made the final payment on the Minnie mine and mill. This company also owns the Lucky mine and mill adjoining the Minnie. Both properties are good producers and will be worked vigorously, and besides the shipments of high-grade ore that can be made from the properties, the large bodies of milling ore will be treated on the ground. This company will open an office in Breckenridge.——Fresh excitement has been caused by the finding of rich copper float in the Copper Flat vicinity, and assays have gone as high as 30% copper from surface rock.——Widmar & Dean, lessees of the Silver King mine on Nigger hill, have shipped two cars of galena ore.—— The lessees on the Dunkin property are shipping ore from the workings, which are reached by a tunnel running in from the railroad level.

Breckenridge, May 18.

SAN JUAN COUNTY.

(Special Correspondence).—Work in the San Juan district is opening up rapidly after the heavy snows of the winter. John Kemmerer, the manager of the Peerless San Juan Mining Co., situated in Minnie Gulch, at Silverton, recently placed an order with the John A. Traylor Machinery Co. for a 420-cu. ft. cross-compound belt-driven air-compressor, 75-h.p. A. C. motor; also Hardsocg Wonder air-hammer drills, and piston drills. The company has struck some good ore, and hand-work is too slow.

Denver, May 18.

IDAHO.

IDAHO COUNTY.

(Special Correspondence).—Specimens of ore from the Yellow Boy mine on the upper Snake river look well. The ore, which is silver-lead, with some gold, is found principally where the veins cut the quartzite formation. The owners have driven two tunnels. Tunnel No. 1 is in 150 ft., showing ore the full length, and at the face the vein is six feet wide. At the foot-wall side there is a streak of galena assaying 60% lead, and 30 oz. silver and $12 per ton in gold. Tunnel No. 2 is 100 ft. below tunnel No. 1 and is 300 ft. long. At the mouth of this tunnel a small amount of high-grade ore was encountered, and at a distance of about 325 ft. it is expected that the main body of ore will be encountered. On the dump the company has 50 tons of high-grade shipping ore running $90 per ton, while there are 500 tons of concentrating ore that runs from $5 to $20 per ton.——The Butte & Orogrande Mining Co. will spend some money in further developing the Hogan mine in the Buffalo Hump district, on which, last year, $50,000 was spent in experimental work. In 30 days active development will be commenced. Last year the glory-hole system was tried, but it is likely that some other system will be used on the Hogan hereafter.——The stamps of the South Fork mine in the Elk City district are now in operation, and the owner, E. E. Espey, expects to run them all the time. This mine is the one from which $1,480 was taken in 21 days during the last season.——In two months work on the upper American river, C. E. Svenson, a placer miner, has extracted $600. In three seasons of work, averaging only two months to the season, he has taken out something over $1,600.——The Golden Rule, on the upper American river, with the eight-mile ditch ready for use, is expected to be a big producer Last season the company operating the Golden Rule found it profitable to handle gravel of five cents per cubic yard, and it is believed that the gravel will run from 45 to 75c. per cu. yd. The new ditch will carry 700 miner's inches of water, so that 1,000 cu. yd. of dirt can be handled in 24 hours.

Lewiston, May 20.

The Big Baldy M. & M. Co.'s property on Crooked creek, 10 miles south of Buffalo Hump, is to be thoroughly exploited during the coming season. Development work has been going on for the past two years. The proposition consists of 22 claims, and 300 ft. of tunnel work has been done. Eleven veins have been explored and show gold and silver ranging as high as $60 per ton. A power-plant will be erected and the surplus power of from 500 to 700 h.p. will be carried to Buffalo Hump for the use of mining plants at the camp.——The Rubberneck mine at Lucile, on the Upper Salmon river, has been vigorously worked this winter. Henry U. Huber announces that a tunnel 270 ft. long has been run and will be extended 150 ft., where it is expected to cut the main vein. One vein 18 ft. wide was struck at a depth of 140 ft., which shows free gold on the foot-wall. Mr. Huber reports that I. Cleaver, superintendent of the McKinley group, has struck a five-foot vein of the richest ore yet seen in the McKinley mine.——The Blue Jacket, operated by the Northwest M. & M. Co., has nearly completed a 900-ft. tunnel with cross-cuts. The mine will be operated all summer. The Crook Corral mine, which has been unable to run for two years on account of water, has been opened. This mine is on the divide between the Salmon and the Snake, and with sufficient water to operate it, is a money maker.——E. A. Henchilwood of Elk City, has discovered a new placer ground of unusual richness, west of the American river bridge on the Orogrande road. The area of the ground is small, but prospecting has proved it to be wonderfully rich. The new placer is not far from the famous Grubstake placer, which played a prominent part in the history of the early days of the district.——George B. McCall of Chippewa Falls, Wis., announces in Spokane that $50,000 will be spent this summer on development work and new machinery for the Hogan mine, in the Orogrande district, in central Idaho. The plans are complete and they embrace the expenditure of nearly $500,000 on the mine, of which 10% will be spent this year. The Hogan mine is the property of the Crooked River M. & M. Co., the stock of which is to be exchanged for that of a new company, the Butte & Orogrande Mining Co., with a capital of $3,000,000. Articles of incorporation for the new company have been filed in Idaho.

KOOTENAI COUNTY.

The Boston group of claims, on Strong creek, six miles north of Hope, has been bonded by J. W. Messner, of Baker City, Ore., owner of the Buck Horn group, eight miles above Bonner's Ferry, for $86,000. The purchaser is to begin development work not later than June 15, and do not less than $2,500 worth of development work before September 1, at which time the first payment of 5% of the purchase price is to be paid. There are five parallel veins running through these claims, but most of the development work has been done on the Boston claim. On the surface this vein seems to be seven feet wide, but in a tunnel at a depth of 60 ft. the vein was 18 ft. wide. It is wholly a gold proposition. The Idaho claim above the Boston has had some development work done on it and a 100-ft. tunnel makes a showing similar to that of the Boston.——At a meeting of the stockholders of the Blue Bird Mining Co. the following trustees were elected for the ensuing year: W. S. McCrea, W. C. Ufford, Charles Theis, J. M. Jeannot, and F. E. Goodall. L. N. Baker was chosen secretary. The property is situated on Lake Pend d'Oreille. Considerable work has been done and a body of ore opened up that carries silver and copper. The work now being done is toward opening the stopes. It is understood that when the Panhandle smelter begins operations it will be prepared to treat the full output of the mine.

SHOSHONE COUNTY.

(Special Correspondence).—Ten per cent payment on the $150,000 bond of the Blackhorse mine in the Murray district of the Cœur d'Alene, owned by Charles Manley, was made by Patrick Burke, who holds the bond. This is the second

payment made by Burke on the property, the former one being made in January, for 10%. The balance is to be paid within a year. Mr. Burke plans to drive a long cross-cut to open the mine at a depth of 1,000 ft.——John A. Finch, of Spokane, has completed a transaction by which Al Page, of Wardner, has bonded the Nevada-Stewart mining property for $125,000. The property is on Pine creek and adjoins the Surprise mine. Three hundred feet of work has been done in the upper tunnel and 150 ft. in the lower, and some excellent ore has been opened. A large crew of men will be set to work in the mine.——Mr. Page has also taken an option on 100,000 shares of the Surprise mine at 16c. The property consists of four claims on the south side of Kellogg peak, 2½ miles south of Wardner and on Stewart creek. The development work consists of about 1,200 ft. of tunnels, 1,100 ft. of cross-cuts, and 110 ft. of driving on the vein. A good showing has been made, and six tons recently shipped show values in lead and zinc of $50 per ton. Mr. Page is to back the company for $25,000, to erect a concentrator. The work on this will be pushed just as quickly as the machinery can be moved, and the mine may be a shipper in 90 days.——A. D. Gritman, manager of the Charles Dickens Mining Co., states that they are doubling the capacity of the plant, but the machinery now being installed is the same as that already in the mill. The concentrates run 63% lead, 31 oz. silver, and less than 5% zinc. The mill was designed after a careful examination of the ore by Otto Trojenoski, of the Hecla mine. The mill will continue to run while this machinery is being put in place. As soon as they close satisfactory contracts with the smelters, shipments will begin.——Burton L. French, of Moscow, has received advices from the Department of the Interior at Washington, D. C., that while 310,000 acres of land in the Coeur d'Alene reservation, beginning 17 miles east of Spokane, will not be thrown open to settlement and entry this year, mineral entry may be made for any of the lands except those allotted to the Indians. It is added: "In interpreting this clause the office has held that the Act also applies to lands in the occupation of any Indian. All coal and oil deposits in or under the lands within the reservation remain the property of the United States, and the Secretary of the Interior is authorized to reserve such tracts for townsite purposes as in his opinion may be required for future public interests." Negotiations are pending for an option

The Coeur d'Alene, Idaho.

on the Nabob mine, near Wardner, by the lead trust. The mine has been under examination by experts for the company and it is understood that a verbal option has been obtained. D. F. Hallahan and associates own the controlling interests in the property, much of the stock being held in Butte. The company is incorporated for 1,000,000 shares, nearly all of which are outstanding. The Nabob has been opened to a depth of 400 ft. by a shaft, and a fine body of ore has been disclosed in the upper workings. Recently shipping ore was opened in the east and west drifts on the 200-ft. level. A carload of ore was recently shipped to the smelter.——A. B. Campbell, of Spokane, and capitalists of New York and Youngstown, Ohio, have closed a deal for 40,000 shares of the stock of the National Copper Co., operating in the Cœur d'Alene. The drift on the property has followed the vein nearly 300 ft., all in ore, much of which is of shipping grade. The ore runs high in silver, lead, and copper. Machinery, including a compressor-plant, a hoist, and pumps, will be moved to the mine at once. The Washington Water Power Co. will furnish the plant with electric power early in June. Charles McKinnis, of Wallace, is manager of the mine and F. Cushing Moore, consulting engineer.——The International M. & E. Co., which has recently acquired three groups of claims in the Cœur d'Alene district, has begun development work on a group on Pine creek, known as Group Eight. A contract has been let to sink a shaft 200 ft., and another contract awarded is for a 300-ft. tunnel. The contracts were secured by F. C. Fox, of Kingston.

Spokane, May 18.

NEVADA.

LANDER COUNTY.

(Special Correspondence).—Some strikes have been made in this district during the past week.——In the Two Widows mine, a shoot of ore was cut by a cross-cut from the bottom of the 100-ft. shaft. The vein carries gold, silver, and copper. The mine is being operated under a bond and lease by P. B. Loeher of Salt Lake.——The Truckee-Greyhound group has been purchased by Colorado and New Jersey parties for $30,000. This property lies between the Gold Quartz and Gem mines, and will be developed by a shaft.——The new hoist for the Gold Quartz has arrived.——Some ore has been encountered, and indications are good.——A strike is reported from the Bridal Wreath, samples of the ore running fairly high. Several men are employed.——The Lander, Phœnix, Gold Quartz, Little Gem, Standard, and Lovey mines are shipping ore, and the Ground Squirrel, Two Widows, Bridal Wreath, Black Rock, and two or three others may do so before long.

Lander, May 20.

LYON COUNTY.

(Special Correspondence).—This district is yielding some rich ore.——At the New Comstock they have just opened up another good vein.——At the Ramsey Comstock some good ore is being mined from a seven-foot vein that was only five inches wide on the surface; at the Bonanza, where a vein was found 85 ft. down, the company has opened up ore that runs well. All of the finds have been on contacts.——The Walkover contains many streaks of ore. H. H. Clark has a group of claims between the Walkover and Ramsey Comstock, and on his Ibex mine there are several showings of ore. Some claims have changed hands and this summer will see a good deal of activity in the district.——The old Garavanta mine is being opened.

Ramsey, May 18.

NYE COUNTY.

(Special Correspondence).—A vein has been uncovered in the 800-ft. level of the Midway, and it is regarded as an important discovery.——The 40-stamp mill of the Montana Tonopah will commence operations in about six weeks, and a big force of men will be put to work in the mine.——At the Tonopah of Nevada, the working force is being increased, and virgin country is being opened.——Operations at the Blue Light mine, at Mina, are steadily progressing and some good copper ore is blocked out. The shaft is down 250 ft. and has tapped a vein.

Tonopah, May 16

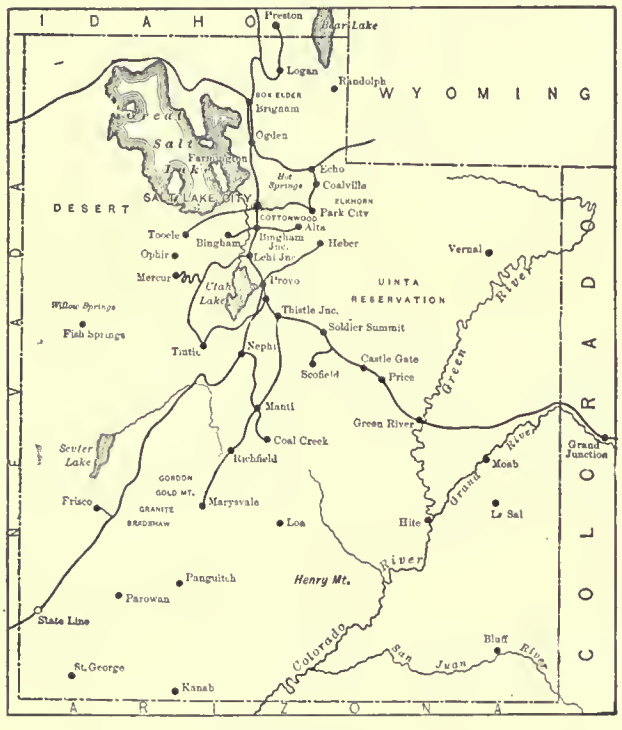
Special Correspondence.

Salt Lake, Utah.

Shipments From Park City. — Railroad Extensions. — Production of Tintic.—New Concentrators.—Consolidation of Mines.—Dividends.

The ore shipments from the Park City district last week amounted to 1,840 tons, the contributing mines and respective amounts being: Daly-Judge, 560; Silver King, 554; Daly-West, 550; Ontario, 176 tons.——For a consideration of $30,000, the Iowa Copper Mining Co. has added additional territory to its Park City property.

It is authoritatively stated that the San Pedro, Los Angeles & Salt Lake Railroad Co. will shortly undertake the construction of a branch line into the Deep Creek district in western Utah; that it is likely that the contract for the first section of the road will be let about the time of the completion of the Caliente & Pioche line, now



Utah.

being built from Caliente to Pioche, Nevada. Three camps have been established and the work of grading has begun on the Eureka railway, to connect the principal mines of the Tintic district with the plant of the Tintic Smelting Co., which is about to be erected for the treatment of lead-silver ores.

The ore shipments from the Tintic district last week amounted to 143 carloads, or approximately 6,000 tons, the contributing mines and respective amounts being: Ajax, 3; Beck Tunnel, 8; Black Jack, 1; Bullion Beck, 2; Carisa, 4; Centennial Eureka, 51; Colorado, 7; Dupue, 5; Eagle & Blue Bell, 5; Eureka Hill, 1; Gemini, 5; Grand Central, 3; La Clede, 1; Lower Mammoth, 8; May Day, 3; Mammoth, 12; Scranton, 6; Swansea, 1; Tintic Iron, 10; Uncle Sam, 3; Yankee Con., 4 carloads.

The management of the Albion mine at Alta has announced that regular ore shipments will be inaugurated about June 10. This company will probably build a mill during the present year for the treatment of its low-grade ores.

The Utah Apex Mining Co. has begun moving low-grade ore to the Markham Gulch mill at Bingham. The Apex company, according to a statement made recently by the management, has about 6,000 tons of such ore in storage and on the dumps. The first unit of the Utah Copper Co.'s new concentrating mill at Garfield is practically ready, and the management is hopeful of placing the plant in regular operation before June 10. The matter of adequate ore transportation facilities is still giving the Utah Copper management something to worry about. The Rio Grande Western Railroad Co. is short of motive power to handle its Bingham traffic.

Shareholders of the Ohio Copper Co. have been notified of a special meeting to be held in Lincoln, Neb., on May 30, at which time the matter of a $600,000 bond issue will come up for consideration, the proceeds to be applied toward meeting the cost of the concentrating mill, now under construction, and the further preparation of the mine for production upon a large scale.——The Honerine Mining Co., with properties at Stockton, will soon call on shareholders for an assessment, which will be applied to paying off the outstanding obligations of the corporation. The Talisman mine in Beaver county is producing regularly. In addition to the lead-silver ores, zinc will probably become an important source of revenue. A 6-ft. vein of zinc ore was recently cut. Zinc has also been found in the Burning Moscow mine, near-by.

The labor difficulties at the United States smelter at Bingham Junction are still unsettled and the plant has been practically out of commission for a week. The men made a demand for higher wages. ——The directors of the May Day and Uncle Sam Consolidated Mining companies in the Tintic district have agreed to a coalition of interests.

Dividends have been declared by the following Tintic companies during the month: Grand Central, $10,000; Beck Tunnel Con., $40,000; Colorado, $40,000; Lower Mammoth, $9,500; the last two named making their initial distributions. The Utah, of Fish Springs, will pay $3,000.——The Beck Tunnel Consolidated Mining Co. has decided to sink a new double-compartment shaft through which the property will be operated in the future. It is expected that it will encounter ore at about 300 ft. depth.——The Newhouse Mines & Smelters Corporation produced a little more than a million pounds of copper during the month of April.

Mexico City.

Esperanza Output.—Other News From El Oro.—The Balsas District.—Failure of a Smelter.—Reasons for It.—Santa Casilda Co.—The Coinage Law.—Its Operation and Success.—Strong Financial Position.

The Esperanza Mining Co., controlled jointly by the English company and the mining department of the American Smelting & Refining Co., in the camp of El Oro, Mexico, though still making an excellent showing, has had its profits reduced of late by a decrease in the grade of the ore, which formerly was figured roughly at 95 *pesos* and is now worth under 70 *pesos* per ton. The ill effect of this upon the reputation of the camp seems to have been more than offset by the recent rich finds of high-grade sulphides in the lower levels of El Oro mine; as these workings are 200 ft. below the lowest workings of the Esperanza, it is taken as proof that the ore persists in depth. Added to this good feature is the splendid appearance of the workings in La Prueba of the Santa Rita company. As the Descubridora has now passed through the cap and is in the slate, encouraging reports are expected from there almost daily. Following the lead of the larger companies, complete electrical equipment has been ordered by both the Chihuahua of El Oro and the Borda Antigua companies, that of the latter having been ordered from Braniff & Co., agents in Mexico for the Westinghouse Co., and the equipment for the mines, together with the new 20-stamp mill, will show

an aggregate of 500 h.p. It is believed the saving over fuel will pay for the equipment aud installation in a year. The Borda Antigua is already preparing for a heavier production from the mine and a larger mill.

The first shipment of 50 tons of high-grade gold ore has been received from the Garduño of the Rio del Oro Exploration Co., in the Balsas district, aud much is expected of the property. Much attention is being paid to the mineral districts of Noxtepec, Poder de Dios, Tetipac, and the Pregoues valley, all near Taxco, and success is likely to follow the properly managed company that goes into any one of these districts.

After about six months spent in alterations and building and a little over a year in actual smelting operations, the Augangeo Metallurgical Co. has closed down its plant as an impractical proposition. This company just two years ago took up under lease the mines and smelter of the Michoacan Mining & Railway Co. at Augangeo and Trojes, Michoacan, after having had them thoroughly examined by several mining engineers and metallurgists. The old smelting plant was entirely gone over and practically rebuilt, all the machinery being run by water-power obtained in the immediate vicinity. Just as the furnace was ready to blow in, a flood came along and almost wiped out the works, necessitating a heavy expenditure in rebuilding. Then an inefficient superintendent for many months caused continued failures, until finally a capable man was obtained and as far as operations were concerned there was no difficulty. After about eight months under the most favorable conditions, consistent with the lease the company held, it was found necessary to close down. The principal causes for the failure were excessively high royalties on a low-grade copper ore; expensive mining, by reason of the wet and poorly developed mines of the English company; high-priced coke, and difficulty of obtaining custom ore. The main trouble, however, was understood to be the high royalty, and unless more reasonable terms can be obtained from the English company, the Augangeo Metallurgical Co., though it has spent something like 300,000 *pesos*, will permanently abandon operations.

The Santa Casilda Copper Co., near La Lombardia, in the Uruapan district, and tributary to the Marquex, Balsas, and Santa Casilda rivers, is said to be producing close to 200 tons per day of 5% copper ore and paying 20% on a capital of 1,500,000 *pesos*. The company is building a concentrating plant so as to make a cleaner product. It is also understood that negotiations are pending for purchase.

Map of Mexico.

The success of Mexico's new coinage law is shown in the statement recently made by the Government to the effect that there have been coined from May 1, 1905, to March 25, 1907, pieces to the value of 80,151,616 *pesos*, of which 57,916,500 is in gold coin ten *pesos* and five *pesos*, the unit of the system being a *peso* containing 75 centigrams of pure gold. There has also been coined 20,970,000 *pesos* in subsidiary silver and the remainder in *centavos;* the total amounts to practically 6 *pesos* per capita of the pop-

ulation. In addition to this there are 98,184,395 in bank bills and from 15,000,000 to 30,000,000 in the old coins not yet redeemed (the exact amount being impossible to figure because of the heavy exportation of past years), or a grand total in circulation of approximately 200,000,000 *pesos*. Of this the bank had on deposit January 31, 1906, 63,574,518. The mints continue the coinage of all the pieces except the silver *peso* up to full capacity, and it is understood that the coinage of the silver *peso*, of entirely new design, will be resumed some time this summer.

Butte, Montana.

The Anaconda Report.—Interesting Details.—Enormous Output.—Good Showing in Depth.—Plans for the Future.

At the annual meeting of the stockholders of the Anaconda Copper Mining Co., held at the Washoe smelter last week, H. H. Rogers, William Rockefeller, John D. Ryan, John E. Judson, E. C. Bogert, William L. Bull, and George H. Church were elected trustees. John D. Ryan, president of the company, submitted his annual report. This shows that 1906 was the biggest year in the history of the company, the profits having been $8,842,669. The balance sheet gives the following interesting figures:

Capital, in 1,200,000 shares at $25 each	$30,000,000	
Accounts and wages payable, including taxes	1,670,239	
Dividend No. 25, payable January 17	2,100,000	
Balance December 31, 1905		$7,210,572
Profit for year ending December 31, 1906	8,842,669	
Deduct four dividends paid	6,900,000	16,083,241
Leaving net surplus		9,183,241

The assets include the following:

Fixed assets, including mines, mining claims, lands for reduction plants, tailing, ditches, sawmills, townsites, etc	20,514,706	
Buildings, machinery at mines, sawmills, refinery, foundries, waterworks, etc	3,923,057	
Investments in sundry companies	531,560	
Insurance unexpired	48,468	
Materials and supplies for use in future operations	1,438,578	
Merchandise held for sale	565,926	
Copper, gold, and silver on hand	5,306,003	
Loans and accounts receivable	10,636,132	
Total assets		$42,964,430

The profit and loss account for 1906 shows:

Copper, silver, and gold on hand at beginning of year	85,761,104	
Mining expenses, including development and depreciation	5,870,439	
Ore, matte, and copper purchases	315,091	
Transportation on mines to reduction works	234,149	
Reduction expenses at Anaconda, including depreciation	4,424,278	
Transportation of metals from West to East, refining, and selling expenses	1,721,965	
Administration expenses	57,672	
Balance, not including interest	8,584,169	
Total		$26,968,869
Sales of copper, silver, and gold	$20,955,532	
Royalties	60,631	
Dividends on investments	36,100	
Rental of water rights	50,000	
Miscellaneous receipts	172,988	
Net profits of subsidiary departments, after deducting depletion of coal and timber plants, and depreciation of plants and equipment	387,615	
Copper, silver, and gold on hand at end of year	5,306,003	
Total		$26,968,869

Mr. Ryan says that all departments were in continuous operation during the year, and an increased amount of ore was treated for other companies, thus reducing the cost of treating its own ores. On account of the higher price for copper, there has been a greater proportion of low-grade ore mined, and the reserves of the high-grade ore have been increased largely. Through the economies introduced in the operation of mines and the smelter, and the higher price for copper, it was possible during the year to mine at a profit ore as much as 1% lower in copper than the lowest grade considered profitable during the last few years. Mr. Ryan speaks of the settlement of all the litigation in which the company had been involved, and the acquisition of the Belmont mine, confirming the report that it is the intention of the company to convert the Belmont shaft into a large three-compartment shaft and connect it with all the important levels of the Anaconda group of mines, thus providing additional outlet for ore. He also mentions the settlement of the labor questions and wage schedule based on the price of copper. The development of the mines has been pushed, and the important shafts were sunk deeper. The 2,200 and the 2,400-ft. levels of the Anaconda, the 2,200 of the Never Sweat, and the 2,000 of the St. Lawrence, on all of which the main Anaconda vein was cut, are now open and ready for stoping. The width and value of the veins at those depths are very satisfactory. On the 1,600-ft. level of the Anaconda extensive development work has been done on the south vein in high-grade ore. The Never Sweat shaft is now at the 2,400-ft. level, but the veins have not been cut at that depth. The St. Lawrence shaft is down 2,100 ft. In this mine No. 5 vein has been developed on the 1,500 and 1,600-ft. levels and shows good ore. The High Ore shaft has been sunk during the year from the 2,200 to the 2,600-ft. level, and one vein was cross-cut at the 2,400, showing pay-ore. The Diamond and Bell mines were not deepened during the year. A vein of good ore has been opened to the south of the former workings in the Diamond and Bell, and on five levels has been followed, showing good ore of considerable width. Ore of good grade has been opened in the Mountain Con. below the 400. The Gallatin, J. I. C., and Belmont produced a limited tonnage of fair-grade material, and all the mines of the company during the year produced 1,450,601 tons of ore. A good profit was netted from the precipitating plants.

The reduction works of the company treated 3,006,910 dry tons of ore and other material, of which 1,494,828 tons were ore, 18,496 tons slime, 3,324 tons flue-dust, 166,516 tons slag, and 654 tons of miscellaneous cleanings from the old works, from which there was produced 94,963,835 tons copper, 2,979,908 oz. silver, and 15,984 oz. gold. Additional blast-furnace capacity and McDougall roasting furnaces were added during the year, and still further extensions are under construction. The electrical equipment of the concentrator has been completed, and an experimental plant to leach tailing from the dumps of the old works has been running with success and profit. An increased product of arsenic has been recovered from the flue-dust, and a good price is being received for it on contract for the entire output.

The subsidiary departments made profits of $387,615. The coal mines at Belt produced 291,851 tons of coal. The sawmills at Hamilton cut 39,832,867 ft. of lumber and timber, of which 4,545,223 went into company use and 35,287,644 ft. were sold. The Butte, Anaconda & Pacific railway, owned by the company, transported during the year 4,615,146 tons of freight and ore, and 195,630 passengers; gross earnings were $1,187,837; operating expenses, $755,735; taxes, interests on bonds, and rental on leased lines, $89,907; net income, $342,193. A dividend of 6% on the railway capital stock was paid, amounting to $60,000, leaving a surplus for the year of $282,193.

During the severe weather last winter it was found that the large tonnage of ore handled, when frozen, would tie up more equipment than the railway has available, so four additional locomotives, 100 steel dump-cars, and 75 flat cars, have been ordered and should be delivered before the beginning of next winter.

Cripple Creek, Colorado.

Treatment of Tailing.—Activity of Lessees.—Unwatering the Gold Coin.—Suit Between the Portland and Independence.—The Drainage Adit is Started.—Experiments on Low-Grade Ores.

The American Milling & Reduction Co. has recently been incorporated, with Colorado Springs as the principal place of business. The company has under consideration the erection of a plant to treat the large tailing dump of the old Gillett mill, situated near the town of that name in the northern part of the Cripple Creek district. An average value of $5 per ton has been obtained from the tailing.——A new vein has been encountered on the 1,200-ft. level of the Portland No. 2 shaft on Battle Mtn. A cross-cut at this depth found the vein 100 ft. north of the shaft. The vein is four feet wide and assays about $20 per ton. The cross-cut will be continued to connect with the winze sunk from the 1,100-ft. level, which shows some ore all the way.

Ore is being shipped from the Gold Dollar mine on Beacon hill. Returns around $30 per ton have recently been obtained from two carloads shipped to the Eagle sampler. The Beacon Hill Development Co. has this property under lease, the ore being obtained from a 3-ft. vein on the 600-ft. level of the Mabel M. shaft.——The operation of uncovering the pump on the 1,000-ft. level of the Gold Coin shaft of the Granite company has not, as yet, been successful. Various mishaps have attended the use of the bailer in lowering the water; at one time the guides in the shaft were torn up for several hundred feet, necessitating repairs. It is doubtful whether the size of the pump and water-column is sufficiently great to undertake the draining of the Battle Mtn. properties, as suggested, through the Gold Coin shaft.

The suit of the Portland Gold Mining Co. *vs.* Stratton's Independence, Ltd., will come up for trial before Judge Lewis in the Federal Court on May 20. The plaintiff company sues for damages approximating $100,000, for ore said to have been extracted by the defendant company and its lessees from the plaintiff's property. Both companies have had engineers examining the disputed territory and the case will be of much interest.——Last Saturday, the 11th inst., the starting of the work on the deep drainage tunnel was celebrated. The day was a general holiday in the district and many hundreds of visitors came from Denver, Pueblo, and Colorado Springs to witness the proceedings and see the camp. Lieutenant-Governor Harper started the compressor, and two drills that were already in place commenced work on the bore. The driving should now go on uninterruptedly.——The Golden Cycle mine resumed operations on the 14th inst. after a shut-down of two months, during which time skips have been installed in the main shaft to facilitate the handling of the ore. The Theresa shaft will be used for lowering the men and timbers. Development work will be continued on the 1,200-ft. level, where a cross-cut is being driven from the Legal Tender vein in a northwesterly direction to cut, if possible, the Hill vein, which should not be far off.

The experimental tests being conducted at the new Blue Flag cyanide mill are turning out favorably. About 25 tons of the low-grade ore is being handled, which will be increased to 75 tons per day when the tests are concluded.——The sinking of the Index shaft a distance of 200 ft. has been completed by the Ætna Leasing Co. The shaft is now 970 ft. deep and stations have been cut at the 870 and 970-ft. levels. Cross-cutting is in progress, with the hope of cutting the extensions of the Pointer, Mint, and Keystone veins. Shipments have been curtailed during the sinking of the shaft to two or three cars per week. Ore is being mined by the company on the 365-ft. level and on the 700-ft. level by Martinson & Co., lessees.

The British-American Mining Co. has declared a dividend of $2,500. This company has a lease on the South Dante on Bull hill, and is sinking a shaft to connect with the Dante workings above the Trail tunnel. Sinking is going on rapidly, a depth of 75 ft. having now been attained. An 8 by 10-in. hoist and 40-h.p. boiler are being installed at the shaft. The air for the drills is being obtained from the big compressor at the Logan mine, but on completion of the shaft a compressor will be installed by the British-American Co.——A strike is reported on the Rose Nichol mine, situated on Battle Mtn. The Columbia Leasing & Development Co. is operating this property and has found a vein from 4 to 5 ft. wide on the 450-ft. level.

An experimental cyanide mill for the treatment of low-grade oxidized ore from the Cariolanus lease on Battle Mtn. is being erected. The mill is being built at the mouth of the Columbine adit in Eclipse gulch, through which operations are being conducted.——A contract has been awarded to J. C. Kenard and C. K. Koocher to sink the main shaft of the Delmonico mine on the southwest slope of Ironclad hill from the 600 to the 1,000-ft. level. Forty days are allowed to complete each 100-ft. lift, at which a station is to be cut, and an indemnity bond of $1,500 is to be deposited by the contractors. Large bodies of low-grade oxidized ore are exposed in the upper levels of the mine.

London.

Zinc Corporation.—Battle of the Processes.—The Elmore Oil Process.—Report of Esperanza.—Other Mexican News.—Camp Bird Report.—Australian Companies in Cornwall.—Production of the Waihi Mine.

The difficulties of the Zinc Corporation Ltd. have now been explained by a circular issued by the London committee. It appears that in August last, after a long time and a great deal of money had been spent on experiments, with the Potter process, it became clear that this process, unaided, was not a success, but in consequence of Mr. A. L. Queneau's conviction that the Potter process, with the addition of magnetic separation, would produce better results than could be obtained in any other way, his recommendation was adopted, and Mr. Queneau was appointed manager. After six months' trial, during which the promised results were not attained, with the exception of one run of 1,300 tons, he was superseded. Mr. Huntley was appointed manager. Mr. Hoover (a partner in the firm of Messrs. Bewick, Moreing & Co. and a director of the company) had just then arrived on the field, and after some further experiments with the Potter process, this was finally thrown out and the Cattermole process adopted, as reported in my correspondence early in April. The last named process is owned by Minerals Separation Ltd., and at the Central mine, Broken Hill, the recovery from 4,178 tons of tailing was 76% silver, 70% lead, 81% zinc; and from 1,954 tons, 74.6% silver, 67.8% lead, and 83% zinc. Owing to the great delay involved by the experiments with the Potter process the capital of the Zinc Corporation will not be sufficient to carry the Company forward until the No. 1 plant of 1,000 tons per day will be in work; therefore, a temporary loan of £50,000 has been raised among a few large shareholders, which, with the balance in hand, will enable the company to meet its liabilities and construction work for the next three months, during which time the results of work on a large commercial scale will have been ob-

tained. The latest progress is reported in a cablegram from the Melbourne office, giving details of the production for three weeks to April 20. For the first week the extraction was 60%, for the second 70%, and for the third 73.6%, which figures are considerably below the 81% and 83% previously reported, and compare with 85%, which was expected from the Potter process. In all, 594 tons of concentrate, averaging about 45% zinc, 9% lead, and 10 oz. silver, were produced from 2,325 tons of tailing; but the assay-values cannot be given until agreed with the shippers' representatives, and no particulars as to working costs are mentioned.

Meantime the battle of the processes proceeds unabated. It is announced that the British Ore Concentration Syndicate Ltd. (owners of the British Elmore patents), has issued a writ for infringement against the Minerals Separation Ltd., holders of the Sulman, Picard & Ballot patents, generally known as the Cattermole process. Mr. A. S. Elmore, presiding at the first annual general meeting of the Ore Concentration Co. held last week, stated that the important installation of the Company's process now being made at the Cape Copper Co.'s mine in Namaqualand would yield a handsome return on their investment. Among the numerous contracts now in hand, they were carrying out trials on a bulk parcel of low-grade banket ore from a well known mine on the Rand at the Company's testing works in London. He referred to the successful work done on the Broken Hill zinc tailing, and was satisfied that when some of the much advertised processes had become extinct by reason of their high working costs and other disabilities, the Company's process—because of its low working costs, high efficiency, and extreme simplicity—would find a large application in the field. As indicating the rapid development of the business during the last few months, he mentioned that 72 machines were on order, seven of these being for Great Britain. A striking testimonial had been received from the Sulitelma company in Norway, which after installing one of the Company's 5-ft. machines had ordered 18 additional machines. While the Elmore process, in its fundamental form, is well known to professional men, the uninitiated layman may find the following description useful. The action of the process depends on the affinity between oil and metallic ores and the reluctance of the gangue to mix with oil. A small proportion of heavy oil and acid is thoroughly mixed with the pulped ore and a fair quantity of water. The oil attaches itself to the particles of ore, but leaves the gangue absolutely untouched. The mixture flows in a continuous stream through a vessel, in which it is subjected to a vacuum. This extracts the air dissolved in the water, in the form of minute bubbles. These attach themselves to the oiled particles of ore, which then float to the surface of the water, and are collected as they are washed over the top edge of the vacuum vessel by the flow of water. The gangue remains at the bottom of the water, and is drawn off by a tailing-pipe. The amount of oil and acid used is so small, and the cost so low, that they need hardly be considered. The amount of power also is small. A unit, consisting of a 5-ft. Huntington mill, 3-ft. concentrator, and all the auxiliaries, can be driven by about 18 h.p. One of the most striking results obtained by the Elmore process is a 98.2% recovery of zinc from the tailing at Broken Hill. But it is said to be equally applicable to almost all metallic ores. A 96.4% recovery of gold from antimonial quartz, 97% of molybdenum, and 99% of copper from Welsh slate gangue is given among the results.

In their third annual report the Esperanza directors are able again to congratulate the shareholders on the "phenomenal yield of gold" which the property has made in the past year. The Company was formed in October, 1903, with a capital of £455,000 in £1 shares, to acquire 449,800 out of a total of 450,000 shares of $5 each in the Esperanza Mining Co., registered in New Jersey, the property of the American venture consisting of approximately 384 acres, adjoining the El Oro mine in Mexico, with a battery of 120 stamps and cyanide-plant. Dividends commenced in June, 1904, and up to January last the distributions have amounted to £2 10s. 6d. per share, or 252½%. During the past year 207,183 metric tons (2,205 lb.) of ore were produced, as compared with 204,299 tons in the preceding 14 months, the value of the bullion extracted having been £1,581,309, as against £1,095,768. The net profit on the year's operations was £952,673, contrasting with £384,143 for the previous 14 months, while the dividends, totaling 160% for the twelve months, amount to £703,859, as against 82½%, taking £375,375, in the previous period. The American company, after providing the last dividend for the Esperanza shareholders, had a balance of cash and realizable assets of £455,757, or a little more than the total capital of the owning undertaking. In addition to the ore reserves, which are expected to leave a profit of about £304,000, there are several points in the mine where pay-ore is now being developed; while on the west veins on the sixth level, north and intermediate, the ore is extending farther to the north than was expected. The recent developments in the northern portion of the property near the line between the Mexican mine and the Esperanza, have been favorable, although the work has not at present advanced sufficiently to permit of a definite statement as to its value. On the sixth intermediate level on the west vein, the north drift is still going forward, and the breast at the close of the year showed the vein to be 7½ ft. wide, assaying 12 oz. gold per metric ton, and on the sixth level itself there is a vein of 4½ ft. quartz, assaying 4 oz. per ton. Recent developments on the San Rafael vein in the El Oro mine, 300 ft. deeper than the Esperanza seventh level and about 500 ft. from the south boundary of the Esperanza, indicate the probability of the occurrence of another ore zone in depth. The monthly report for March states that the mill ran 26 days and crushed 11,942 tons of dry ore. Shipped to smelter 1,703 tons dry ore. Net estimated profit at the mine, $122,023. Shipping ore on hand, 1,400 tons. The shortage of cars still continues. Development work, 784 feet.

The profit for March of the neighboring El Oro mine is also announced, the amount being $81,625. Dolores shows a profit for the same month of $24,000. The English company—Dolores Ltd.—has declared a further interim dividend of 3%, making in all 6% on the issued capital of £396,000 up to the present. It is rumored that the mine is not looking quite so well at the bottom level, also that some little time must still elapse, owing to the continued delays on the railway and the mule-trail, before the mill can be working to full capacity.

The profit at the Camp Bird for the month of March was $164,585. The mill ran 30 days, and crushed 6,069 tons of ore (dry weight), yielding 10,757 oz. bullion, and approximately 679 tons of concentrate. There was expended on construction $695, making a total for the year commencing May 1, 1906, of $26,564. Feet of development work, 637.

Two London companies operating in Western Australia, the Cosmopolitan Proprietary and Hannan's Proprietary, have conjointly taken over a tin mine in Cornwall—the Phœnix United. The property consists of about 560 acres, and is held under lease direct from the owners, the Duchy of Cornwall. The Phœnix has been

a large producer in the past, it is said, but has not been worked for ten years. Experts seem to be of the opinion that if the mine is fully opened and equipped with modern machinery, it might be worked to advantage. It is understood that the plans and specifications for the necessary plant for unwatering have been prepared, and a large proportion of the plant ordered. It appears that the amount to be provided for the development and equipment of the Phœnix is £75,000. It is announced that Capt. Oates has been appointed local manager of the Wheal Jane group of mines, in the Chacewater-Kea district, where A. W. Jenkins is the general manager. Pumping will soon be in operation at Wheal Vor, R. Arthur Thomas having laid out a modern plant for dealing with the minerals of this once famous sett.

Waihi, the premier New Zealand gold mine, has issued its annual report for 1906. The *Financial News* sums up the broad results of the Company's working during the past three years in the subjoined table:

	1904.	1905.	1906.
	£	£	£
Gross revenue	68,147	733,561	847,197
Working expenses	317,993	316,968	345,123
Depreciation, etc.	58,489	70,039	93,281
Net profit	311,665	346,554	408,793
Rate of dividend, %	60	65	75
Ore crushed (tons)	291,175	298,531	328,866
Yield per ton	46s. 2d.	48s. 9d.	51s.
Costs " "	22s.	21s.	20s. 6d.
Profit " "	24s. 2d.	27s. 9d.	30s. 6d.
Ore reserves (short tons)	712,791	938,334	1,029,658

The report states that on the whole the developments of the mine seem to point to a long continuance of prosperity.

Johannesburg, Transvaal.

The Driefontein Accident. — Bad Industrial Conditions. — Political Uncertainty.—Gold Production.—Usefulness of Tube-Mills.

The most distressing mine accident known in the history of the Rand occurred at the Driefontein Consolidated mine about a week ago. There have been many accidents in the past where the loss of life was nearly as high, but never have the victims suffered such agony as the poor fellows at the Driefontein mine, before death came as a merciful deliverer. Sixty-three lives were lost, of whom nine were white men. It is not yet known exactly how the accident occurred. There seems to have been two cases of dynamite (100 lb.) at one of the underground stations. The men were waiting, after the end of the shift, to ride up in the skip. Through the criminal carelessness of some one, the dynamite caught fire. It blazed rapidly, burning the men on the station most cruelly, and then exploded. The vast majority of the victims were blown to pieces, but some were rescued, and died later in the hospital. As far as the law is concerned there is probably no mining country better provided than the Transvaal. The regulations regarding explosives are excellent, and were they carried out to the letter, there would never be an accident from the use of explosives. But the miners are very careless, in spite of the fines that the Government officials make them pay for breaking the regulations. The Driefontein Consolidated mine is one of the East Rand group, which group is in the unenviable position of holding two records, namely, the highest working cost per ton, and the highest accident death-rate. This group is the most 'centralized' on the Rand. They do not have a mine manager on each mine responsible for everything on that mine, but run all their mines from one head office.

The distress in our midst does not get less. The unemployed camp, near Johannesburg, still contains hundreds of idle men. The Town Council made room for a number of white men, by discharging some Kaffirs, but now they seem to grudge the extra expense, and will revert to cheap Kaffir labor again. All the charitable institutions are taxed to the uttermost, and are continually appealing for help. All over South Africa the depression is very pronounced. The root cause of the trouble is the instability of affairs. No one has any idea what the Transvaal ministry, under Botha, will do about the question of unskilled labor. The dread that 20,000 Chinese will be compelled to leave the mines by the end of this year hangs like a heavy cloud over the industrial community. Many of the mines in the poorer zones will probably be compelled to close down, when the highly efficient Chinese labor is sent away. During the past fortnight one of the mines in the Roodeport district announced that all operations would be suspended at the end of this month.

The difference between labor conditions in South Africa and the United States is impressive. If several mines close down there, the workmen seem to find a chance elsewhere quickly, but in this country when a few hundred white men are thrown out of work in Johannesburg, they create a problem of the unemployed. In one sense it is true that "Johannesburg is South Africa," and if

Map of South Africa.

men cannot find employment in the great industry on the Rand, there is not much hope for them anywhere else. The power of South Africa to absorb white immigrants is painfully small.

The returns for last month show that March was a satisfactory month. The output did not reach the record one of December last, when 550,167 oz. were declared; but the March output of 538,497 oz. of gold for the Transvaal, valued at £2,287,391, is highly satisfactory, when it is remembered that there was one holiday, Good Friday, during the month. Of the total Transvaal output of 538,197 oz., the Rand supplied 520,163 oz. During March there were 8,540 stamps at work in the Transvaal, of which 8,190 stamps were crushing on the Rand. The influence of tube-mills is shown in the high duty per stamp recorded by some of the mines using them. The Luipaard's Vlei Estate mine reports the very high duty of 8.2 tons per stamp per 21 hours. This is probably a world's record for an ordinary gravity stamp. The lowest stamp duty is that of the Windsor mine, which crushed 3.5 tons per stamp per day. The mill on this property is an antiquated one. The premier producer in March was the Simmer & Jack, which turned out 23,113 oz. fine gold. The Robinson came next with 22,259 oz., while the Robinson Deep was third with 20,725 oz. There were twelve companies that report a recovery of 12,000 oz. and over.

Concentrates.

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

WHERE a mining claim becomes subject to forfeiture for failure to perform the annual assessment work, such improvements or betterments as may have been theretofore placed thereon, if they fall within the class designated as fixtures, become a part of the realty, and the subsequent appropriation of the land under a valid re-location, carries with it necessarily whatever may be affixed to it. In other words the fixed improvements passed to the re-locator.

WHEN using wooden guides in a stamp battery, the tendency to polish the surface of the stem is greater than with iron guides. This polished surface, however, makes no difference in the holding of the tappets. If a tappet does not hold, it is the fault of the gib. Many mills make their own gibs. When they become worn so that the driven key will not hold the tappet, the gib is changed and a new one inserted. This requires only a few minutes and ends the trouble.

MANGANESE ORES are reported as being widely distributed in Brazil, occurring in the States of Minas Geraes, Bahia, Matto Grosso, Parana, and Santa Catharina. The deposits extensively worked are in the State of Minas Geraes, small quantities only having been shipped from the Bahia mines. The Minas Geraes manganese ores occur in the mining zone of that State which is traversed by the Central Railway system entering the district at Lafayette, 465 km. from Rio.

IF the mining claims were located prior to the grant of the right of way to the railroad, although not recorded until afterward, such right of way would be inferior to the rights of the mining claims, provided, of course, that at the time the location was made the land covered by the mining claims was public land. If the land had been previously patented under the homestead laws, the mining locations are void to the extent that they conflict with the homestead patent. Under such circumstances the right to mine should be acquired from the owner of the patented title.

WHILE unpatented mining claims are property and subject to taxation, the nature of the title taxed is possessory. The interest of the owner is taxed, not the fee of the land, as that belongs to the Government. If the owner permits his claim to be forfeited by failure to perform the work and suffers a valid re-location to be made by a stranger in hostility to him, the interest of such owner is extinguished. The re-locator acquires a distinctive new property, which in turn is subject to taxation. The lien for taxes previously attaching to the interest of the prior owner is, as against the re-locator, likewise extinguished.

THE value of the assessment work is not necessarily determined by the contract price, or the amount paid. These may be elements more or less persuasive where the question of aggregate value is a close one. The true test is, what is the reasonable value of the work done considering the local environment? The remoteness of the claim and the time and expense necessarily involved in reaching it, where the camp is inactive and labor is not obtainable, may under certain conditions be considered in estimating the value of the work. A mere expenditure is not sufficient. The work must tend to develop the claim and be of the reasonable value required.

MINERALOGICALLY, micas are aluminous silicates having a perfect cleavage. The more common micas are biotite, the ferro-magnesian variety, phlogopite or magnesian mica, muscovite or potash mica, and lepidolite, which contains lithium. The last named is important only as a source of lithia salt for the chemical trade; and biotite, because of its dark color, iron content, and occurrence in smaller plates, has never been extensively used. The two commercially imported micas are muscovite, the white or water mica of the trade, and phlogopite, loosely termed amber mica. Muscovite is usually of a silver-gray or light-yellow color, and is very transparent and often almost colorless; exceptionally, however, as in some of the Indian localities, dark red muscovite is found. Phlogopite is of varying shades of brown.

COUNTIES, as such, have no power to grant rights of way to railroads over private property. Their powers are limited to the granting of such rights along the public roads and highways. A mining claim may be located across a previously dedicated public road, traversing the public lands, but the right to mine would have to be so exercised as not to interfere with the public right of travel. A tunnel might be run under the road, provided adequate provision is made to support the surface. The same rule would apply to railroad rights of way granted by counties over and along public highways. The rule would be different if the railroad company had acquired its rights over public lands under acts of Congress, and prior to the location of the mining claims.

THERE are two methods of acquiring title to coal lands on the public domain:

(1) By ordinary private entry under the provisions of Section 2,347 of the Revised Statutes.

(2) By pre-emption or preference right of purchase under Section 2,348.

The first method may be exercised upon surveyed lands without previous occupation or improvement. To obtain title to lands under this Section, the affiant is required to file with the Register of the proper land-office a verified application, which must show the qualification of the applicant, and that the land is chiefly valuable for coal. This does not necessarily mean that coal must have been actually produced from the tract sought to be purchased. In such cases the characteristics peculiar to coal deposits are to be kept in view and the presence of such deposits may be determined upon authenticated evidence of conditions which constitute the sufficient guide of the geologist or coal expert (34 L.D. 194). This method, however, requires payment to be made or tendered simultaneously with the filing of the application.

The second method requires the applicant to be in actual possession of the lands applied for and to have opened and improved the coal mine before making final entry. Within sixty days after the date of actual possession and commencement of improvements, the claimant must file with the Register a declaratory statement, which preserves the preferential right of purchase for the period of one year.

Both methods are explained and distinguished by the Secretary of the Interior in the case of McGibben *vs.* Gable (1905), 34 Land Decisions, page 178.

If the lands are open and unoccupied they should be taken possession of at once, and exploration commenced. This possession would protect the claimant as long as he prosecutes his work with reasonable diligence and files his declaratory statement within sixty days.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy.

The Lost Lead.

The Editor:

Sir—It would appear that not alone in technical journals, such as the MINING AND SCIENTIFIC PRESS, may we learn the most modern theories of ore-deposition. It was but the other day in a London monthly periodical, not hitherto noted for any brilliancy regarding scientific exposition, but still of time-honored standing, that I came across the above heading.

On reading the article both data and theory were so distinctly novel that, perhaps, the story may bear re-telling, for the benefit of any other of your readers not quite abreast of these rapidly moving times in which we live.

It appears that some years since, in Colorado, two lucky prospectors struck a surface patch of silver—in fact, the silver adhered to the grass-roots in nuggets "of almost pure silver." The deposit proved limited and eventually gave out. Many attempts were made to trace the lead, but all in vain; hence the title, "the lost lead."

There came to those parts a miner of great experience from California, attracted by the story of this lost lead. After examining the available data, "he was of the opinion that the ore had come from a considerable distance, that, in fact, at some remote period it had been belched forth from the fiery throat of a volcano. Hurled high in the air, it had described a long arc to the south, and settled in the stream of lava which had flowed into the plain. He calculated as closely as possible the arc which the ore must have described through the air, and eventually pitched upon a rugged hill seven miles away, from which he believed it had been originally hurled."

On an examination of this hill there was no evidence either of a volcano or silver. However, so convinced was he as to the soundness of his deduction, that he proceeded to Boston, and so earnest and straightforward was his talk to capitalists that he returned to Colorado with the capital to prove the existence of the enormous masses of silver, which, he assured them, "although they might have to bore a mile for it, once they find it, they could quarry it like stone."

An adit was started into the hill, 50 ft. wide by 8 ft. high. Possibly the gentleman had read of the difficulty of getting the hundreds of tons of mass copper in the Lake Superior mines to surface, and he was not going to be so caught. After the adit had progressed a few hundred feet, and they had, as the narrative quaintly remarks, "in places to bore through the solid rock," they came across a single slug of silver weighing about one ounce, which, upon comparison, was identically similar to the surface deposit. Catching the next train to Boston, the worthy expert laid his unimpeachable evidence before the directors with the remark that his theory had been amply justified and here was the evidence.

The books showed that this ounce of silver had cost just $150,000. However, nothing daunted, the directors put up fresh capital and the expert returned to Colorado. He now figured that he would encounter the deposit better by a shaft, and, although he calculated that 1,500 ft. would give results, yet double that distance would probably be passed before anything quite satisfactory was shown up; and, in fact, 5,000 ft. were to be sunk before the enterprise was given up.

Air-drills were procured, a shaft-house built, and hoist installed, and 75 men were set to work three shifts. For years the work went on with no results otherwise than "the powerful rock-drills were grinding continuously through the rocks, though as yet there was no trace of ore in sight. Down, down went the shaft; two steel cages passing each other day and night."

Thus continued the work for five years, but still the 5,000-ft. limit had not been reached and in his mind's eye the expert still saw those masses of solid silver buried in the depths of the hill. A year or two later "a great streak of silver-bearing mineral was discovered, which was followed along the dip for over 1,000 ft. Sometimes the ore was rich in silver, sometimes it hardly yielded any. It is estimated that about $250,000 was brought back to the coffers of the syndicate, though exact particulars were never allowed to leak out."

The description ends in a most unsatisfactory way, declaring that the work was still in progress and apparently the solid silver quarry had not yet been reached.

Now, Mr. Editor, is not this a trifle tall, even for Colorado; a sort of 'way-beyond-the-dreams-of-avarice' talk of the pseudomorphic expert? This solid-silver volcanic-projectile-theory needs a whole lot of sustaining even with the proverbial grain of salt. In fact, it is the most utter twaddle that could be penned, and it is apparently a proof of the general ignorance of such matters that even a reputable publication could be so deluded as to disseminate such mis-information.

For this reason the matter is seriously brought before your readers.

COUSIN JACK.

New York, May 5.

Mining Schools and Their Graduates.

The Editor:

Sir — In your issue of April 27, I notice you make a mild protest against the tendency toward exaggeration that is apparent in the year-books and lists of graduates issued by technical schools in this country. It seems to me that something should have been said about this long ago, as every engineer appreciates the absurdity of the claims made by many schools as to the positions held by the graduates, and realizes in a general way that these claims often amount to positive misrepresentation. Of course, we all understand that this is considered good business by the officers of mining schools to make as good a showing as possible, in order to maintain a large enrollment of students, and give a good idea of the professional standing of the men who have been graduated, and this feeling is reflected in the reports sent in by the alumni as to the positions they hold. A man hardly likes to have it appear in print that after two years of work in the field he is still cranking a machine-drill, pushing a tram-car, or wheeling concentrate, especially when he sees all his classmates recorded as 'chief engineer,' 'metallurgist,' 'mine superintendent,' and the like. Consequently, he is tempted to report that he is 'assistant engineer' or 'assayer,' and about the lowest he will permit himself to be designated is 'practical miner,' 'practical millman,' or 'with' the So & So Company. This last expression is especially elastic, and permits of a variety of interpretations, from president of the company down to top-carman; many even omit these minor positions entirely from the list of positions held by them, rather than have it known that they are still doing manual labor.

The bad effects of this tendency to exaggerate are many. In the first place, let us consider the effect that it has on the young fellow who is trying to decide what course to take in college. In examining the student body in the average mining school, an increasing ten-

Concentrates.

This polished surface, however, makes no difference in the holding of the tappets. If a tappet does not hold, it is the fault of the gib. Many mills make their own gibs. When they become worn so that the driven key will not hold the tappet, the gib is changed and a new one inserted. This requires only a few minutes and ends the trouble.

MANGANESE ORES are reported as being widely distributed in Brazil, occurring in the States of Minas Geraes, Bahia, Matto Grosso, Parana, and Santa Catharina. The deposits extensively worked are in the State of Minas Geraes, small quantities only having been shipped from the Bahia mines. The Minas Geraes manganese ores occur in the mining zone of that State which is traversed by the Central Railway system entering the district at Lafayette, 465 km. from Rio.

IF the mining claims were located prior to the grant of the right of way to the railroad, although not recorded until afterward, such right of way would be inferior to the rights of the mining claims, provided, of course, that at the time the location was made the land covered by the mining claims was public land. If the land had been previously patented under the homestead laws, the mining locations are void to the extent that they conflict with the homestead patent. Under such circumstances the right to mine should be acquired from the owner of the patented title.

WHILE unpatented mining claims are property and subject to taxation, the nature of the title taxed is possessory. The interest of the owner is taxed, not the fee of the land, as that belongs to the Government. If the owner permits his claim to be forfeited by failure to perform the work and suffers a valid re-location to be made by a stranger in hostility to him, the interest of such owner is extinguished. The re-locator acquires a distinctive new property, which in turn is subject to taxation. The lien for taxes previously attaching to the interest of the prior owner is, as against the re-locator, likewise extinguished.

THE value of the assessment work is not necessarily determined by the contract price, or the amount paid. These may be elements more or less persuasive where the question of aggregate value is a close one. The true test is, what is the reasonable value of the work done considering the local environment? The remoteness of the claim and the time and expense necessarily involved in reaching it, where the camp is inactive and labor is not obtainable, may under certain conditions be considered in estimating the value of the work. A mere expenditure is not sufficient. The work must tend to develop the claim and be of the reasonable value required.

MINERALOGICALLY, micas are aluminous silicates having a perfect cleavage. The more common micas are biotite, the ferro-magnesian variety, phlogopite or magnesian mica, muscovite or potash mica, and lepidolite, which contains lithium. The last named is important only as a source of lithia salt for the chemical trade; and biotite, because of its dark color, iron content, and occurrence in smaller plates, has never been extensively used. The two commercially imported micas are muscovite, the white or water mica of the trade, and phlogopite, loosely termed amber mica. Muscovite is usually of a silver-gray or light-yellow color, and is very transparent and often almost colorless; exceptionally, however, as in some of the Indian localities, dark red muscovite is found. Phlogopite is of varying shades of brown.

COUNTIES, as such, have no power to grant rights of way to railroads over private property. Their powers are limited to the granting of such rights along the public roads and highways. A mining claim may be located across a previously dedicated public road, traversing the public lands, but the right to mine would have to be so exercised as not to interfere with the public right of travel. A tunnel might be run under the road, provided adequate provision is made to support the surface. The same rule would apply to railroad rights of way granted by counties over and along public highways. The rule would be different if the railroad company had acquired its rights over public lands under acts of Congress, and prior to the location of the mining claims.

THERE are two methods of acquiring title to coal lands on the public domain:

(1) By ordinary private entry under the provisions of Section 2,347 of the Revised Statutes.

(2) By pre-emption or preference right of purchase under Section 2,348.

The first method may be exercised upon surveyed lands without previous occupation or improvement. To obtain title to lands under this Section, the affiant is required to file with the Register of the proper land-office a verified application, which must show the qualification of the applicant, and that the land is chiefly valuable for coal. This does not necessarily mean that coal must have been actually produced from the tract sought to be purchased. In such cases the characteristics peculiar to coal deposits are to be kept in view and the presence of such deposits may be determined upon authenticated evidence of conditions which constitute the sufficient guide of the geologist or coal expert (34 L.D. 194). This method, however, requires payment to be made or tendered simultaneously with the filing of the application.

The second method requires the applicant to be in actual possession of the lands applied for and to have opened and improved the coal mine before making final entry. Within sixty days after the date of actual possession and commencement of improvements, the claimant must file with the Register a declaratory statement, which preserves the preferential right of purchase for the period of one year.

Both methods are explained and distinguished by the Secretary of the Interior in the case of McGibben *vs.* Gable (1905), 34 Land Decisions, page 178.

If the lands are open and unoccupied they should be taken possession of at once, and exploration commenced. This possession would protect the claimant as long as he prosecutes his work with reasonable diligence and files his declaratory statement within sixty days.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy.

The Lost Lead.

The Editor:

Sir—It would appear that not alone in technical journals, such as the MINING AND SCIENTIFIC PRESS, may we learn the most modern theories of ore-deposition. It was but the other day in a London monthly periodical, not hitherto noted for any brilliancy regarding scientific exposition, but still of time-honored standing, that I came across the above heading.

On reading the article both data and theory were so distinctly novel that, perhaps, the story may bear re-telling, for the benefit of any other of your readers not quite abreast of these rapidly moving times in which we live.

It appears that some years since, in Colorado, two lucky prospectors struck a surface patch of silver—in fact, the silver adhered to the grass-roots in nuggets "of almost pure silver." The deposit proved limited and eventually gave out. Many attempts were made to trace the lead, but all in vain; hence the title, "the lost lead."

There came to those parts a miner of great experience from California, attracted by the story of this lost lead. After examining the available data, "he was of the opinion that the ore had come from a considerable distance, that, in fact, at some remote period it had been belched forth from the fiery throat of a volcano. Hurled high in the air, it had described a long arc to the south, and settled in the stream of lava which had flowed into the plain. He calculated as closely as possible the arc which the ore must have described through the air, and eventually pitched upon a rugged hill seven miles away, from which he believed it had been originally hurled."

On an examination of this hill there was no evidence either of a volcano or silver. However, so convinced was he as to the soundness of his deduction, that he proceeded to Boston, and so earnest and straightforward was his talk to capitalists that he returned to Colorado with the capital to prove the existence of the enormous masses of silver, which, he assured them, "although they might have to bore a mile for it, once they find it, they could quarry it like stone."

An adit was started into the hill, 50 ft. wide by 8 ft. high. Possibly the gentleman had read of the difficulty of getting the hundreds of tons of mass copper in the Lake Superior mines to surface, and he was not going to be so caught. After the adit had progressed a few hundred feet, and they had, as the narrative quaintly remarks, "in places to bore through the solid rock," they came across a single slug of silver weighing about one ounce, which, upon comparison, was identically similar to the surface deposit. Catching the next train to Boston, the worthy expert laid his unimpeachable evidence before the directors with the remark that his theory had been amply justified and here was the evidence.

The books showed that this ounce of silver had cost just $150,000. However, nothing daunted, the directors put up fresh capital and the expert returned to Colorado. He now figured that he would encounter the deposit better by a shaft, and, although he calculated that 1,500 ft. would give results, yet double that distance would probably be passed before anything quite satisfactory was shown up; and, in fact, 5,000 ft. were to be sunk before the enterprise was given up.

Air-drills were procured, a shaft-house built, and hoist installed, and 75 men were set to work three shifts. For years the work went on with no results otherwise than "the powerful rock-drills were grinding continuously through the rocks, though as yet there was no trace of ore in sight. Down, down went the shaft; two steel cages passing each other day and night."

Thus continued the work for five years, but still the 5,000-ft. limit had not been reached and in his mind's eye the expert still saw those masses of solid silver buried in the depths of the hill. A year or two later "a great streak of silver-bearing mineral was discovered, which was followed along the dip for over 1,000 ft. Sometimes the ore was rich in silver, sometimes it hardly yielded any. It is estimated that about $250,000 was brought back to the coffers of the syndicate, though exact particulars were never allowed to leak out."

The description ends in a most unsatisfactory way, declaring that the work was still in progress and apparently the solid silver quarry had not yet been reached.

Now, Mr. Editor, is not this a trifle tall, even for Colorado; a sort of 'way-beyond-the-dreams-of-avarice' talk of the pseudomorphic expert? This solid-silver volcanic-projectile-theory needs a whole lot of sustaining even with the proverbial grain of salt. In fact, it is the most utter twaddle that could be penned, and it is apparently a proof of the general ignorance of such matters that even a reputable publication could be so deluded as to disseminate such mis-information.

For this reason the matter is seriously brought before your readers.

COUSIN JACK.

New York, May 5.

Mining Schools and Their Graduates.

The Editor:

Sir — In your issue of April 27, I notice you make a mild protest against the tendency toward exaggeration that is apparent in the year-books and lists of graduates issued by technical schools in this country. It seems to me that something should have been said about this long ago, as every engineer appreciates the absurdity of the claims made by many schools as to the positions held by the graduates, and realizes in a general way that these claims often amount to positive misrepresentation. Of course, we all understand that this is considered good business by the officers of mining schools to make as good a showing as possible, in order to maintain a large enrollment of students, and give a good idea of the professional standing of the men who have been graduated, and this feeling is reflected in the reports sent in by the alumni as to the positions they hold. A man hardly likes to have it appear in print that after two years of work in the field he is still cranking a machine-drill, pushing a tram-car, or wheeling concentrate, especially when he sees all his classmates recorded as 'chief engineer,' 'metallurgist,' 'mine superintendent,' and the like. Consequently, he is tempted to report that he is 'assistant engineer' or 'assayer,' and about the lowest he will permit himself to be designated is 'practical miner,' 'practical millman,' or 'with' the So & So Company. This last expression is especially elastic, and permits of a variety of interpretations, from president of the company down to top-carman; many even omit these minor positions entirely from the list of positions held by them, rather than have it known that they are still doing manual labor.

The bad effects of this tendency to exaggerate are many. In the first place, let us consider the effect that it has on the young fellow who is trying to decide what course to take in college. In examining the student body in the average mining school, an increasing ten-

dency is noted, to draw boys who have never seen a mine, and whose parents or relatives have no idea whatever of what the business is. In considering the fields of industry open to him, the average boy is left to his own devices and can choose what course he will in college. At this tender age, slight influences often result in a decision. While it sounds like an absurdity, I have no doubt that many a boy in knickerbockers has made his decision to be a mining engineer after reading some of the highly colored fiction that is written about the mining business. How many youths have been influenced in their decision to become mining engineers after seeing such plays as Davis' 'Soldiers of Fortune,' where all the young engineer has to do is to accept the challenge of the great hills of hematite which "defy him like the knuckles of a giant fist," draw a large salary, dress in riding breeches or evening clothes, drink long cold drinks under the shade of a palm, and finally marry the president's beautiful daughter. It is a fine idea, and the boy has no one to tell him that this isn't the way it generally works out. Whatever the deciding influence may be, whether fiction, the drama, the newspaper stories, and magazine articles dealing with the romance of mining, or the fact that his father knows a man whose brother made a fortune in mining somewhere 'out West,' and will undoubtedly give him a good job when he gets out, the youngster's next step is to send for he literature published by the school. This he goes over carefully with his family, and finds that "graduates are much in demand," and the list of alumni shows mine owners, managers, consulting engineers, and superintendents scattered from one end of the earth to the other. Looks attractive? Of course it does. That's what it is for. Also, father has heard that everyone who graduates is immediately snapped up at a salary of at least $150 per month, and the romance and mystery of the thing appeals to boy, relatives, and friends alike, and the result is that the boy is packed off to school to become a 'mining engineer' in the short space of three or four years, and lives to regret his choice until the end of his days. I once saw a youth on his arrival in a quiet little college town, with a big new six-shooter sticking out over his hip. For hadn't he read that it was a rough, romantic life, where millions are made and lost in a day, and where one must needs be quick on the trigger. This same youth is now bucking samples in Colorado, and he doesn't pack any gun.

The effect of this exaggeration on the graduate is to make him dissatisfied with his position, and to discourage him by making him feel that he has dropped behind in the race, as he sees by the book that all his classmates are doing better than he. His shame at this may even draw him into deliberate falsehood, in order that he may make as good a showing as the next man (on paper).

The effect on the employing public is a tendency to discredit the list of positions as meaningless when they attempt to pick a man for their own use; while the effect on the school that is a party to all this must be demoralizing. Wherein does the ultimate gain lie? Why not tell the absolute truth about your graduates? If they are mucking, say so; if they are crooked over a drawing-board, as many of them are, record it; and if they are furnishing the motive-power for a one-ton car up a 6% grade, *write it down*. For what does all this attempt to represent the business of mining engineering as a long rosy path amount to if it fools no one in the end; not even the boy who decides to take it up, and does not wake up until it is too late to back out.

Many amusing cases come to view to one who has a chance to compare the reported and actual status of these young graduates. I read of a man who is 'assistant engineer,' and find him tramming with a bunch of Mexicans, his engineering consisting in holding an end of a tape once a week while the shift-boss measures the drift-work. A 'chief engineer' of a big company that ends its title with Consolidated Mines Co., Ltd., is a draftsman at mucker's pay. An 'assayer,' I find bucking samples, at day's pay considerably less than any Dago in the camp is getting. I read of a man who is recorded as 'superintendent of tailings plant,' and on visiting him discover that he is the 'rag-man,' whose business it is to hose the canvas tables every 20 minutes for a 10-hour shift, but, as the company was financially irresponsible, he received not one dollar for his six months' work. A 'chief chemist' I find titrating copper samples at $75 per month, another 'chief engineer' squints through a telescope at a plumb-bob for $75 per month in a camp where a Hungarian gets $3 per day. I have the greatest respect for the man whose record I have before me; he states that he graduated, mined for a time with two companies, became a street-car conductor in an Eastern town, and then a clerk in a 'dairy lunch;' but I learn with regret that he died 11 years after graduation, while clerk in a lawyer's office in a little country town in an agricultural district. *There* was an honest man, but I cannot understand how the college authorities ever let that list be published. Perhaps it is to show that very rarely a man does appear who, through some strange combination of circumstances, does not acquire fame and fortune in a few years in the mining business. But this is the only example of the kind that I can find in a list of over 400 names. I am told that another man is general superintendent of a big mine and mill in Colorado; within six months I find him conducting a billiard and pool resort in Cripple Creek, and just learn that he is 'steering' for a stud-poker game in a Nevada camp. You may be sure those two last positions never appear in the list. They might have a tendency to decrease the size of the next freshman class.

Next I read of the annual report of a mining school, filed with the Governor of the State, in which the president asks for large appropriations for larger quarters, as the "demand for graduates is in excess of the supply," and the school must turn out more men. As I happen to know that out of a recent class of 40 graduates, only three men were placed through the school, and they in inferior positions paying less than manual-labor jobs in the same camps, I am inclined to be a little skeptical of future utterances by this man.

Examples like the above are to be seen on every side. But all this is not meant to indicate that the mining business is a poor one to follow. On the contrary, it is because it is a splendid and legitimate field for operation that we regret these little tricks by which it is handicapped. For, to look a little further into the matter, why should a man prefer, and have it appear, that he is 'engineer' for some company — which generally means surveyor — than that he is pounding a drill with a four-pound hammer. Why should he prefer to be 'assayer,' rather than jig-man in some mill. If I were looking for a man to act as superintendent or manager for some property, I should prefer a man who had started on the business end of a 'muck-stick,' and served his time at mining and timbering, rather than a man who had spent a similar amount of time adjusting a transit, working with a six-place logarithm table, and putting fancy titles on maps. If I had a producing property equipped with a mill, I would not put a man in charge because he had been assaying for five years. As far as learning anything about mining is concerned, outside of the atmosphere of his environment, a man might as well be cooking flapjacks in some 'dairy lunch,' as running through

the mechanical routine of 40 or 50 muffle-fusions per day, month after month. I would rather make the roustabout at the mill, or the tool-nipper at the mine, boss of this property, than the assayer. I think a good many men agree with me, and if this is true, then the man who subscribes to the plan of misleading reports of positions is defeating the very end for which he is striving. We see too few miners, timbermen, shift-bosses, and foremen on the lists. Facts seem to prove that the business of mining engineering presents quite a different problem to the young technical graduate at present than it did ten or fifteen years ago. At that time the number of graduates was small, and there was a corresponding brisk demand for their services. At present, there is hardly a State university that does not include in its curriculum a course in mining, while the long-established mining schools are turning out large classes each year. Price, supply, and demand being three variables so related that a change in one brings a change in all three, the result of a vastly augmented supply has lessened the demand and the price. Not to mince words, the field of mining engineering is as crowded as any profession, and the young graduate must make up his mind to travel a more or less rocky road, for the first few years at least. Upon graduation, he must make his way to some Western camp, and start at the bottom. One year on a tramcar, and two more spent wielding a Missouri No. 2 should not discourage him, for all his college course can do is to prepare him for learning, and for the first two or three years he is of little value to anyone, and is going to a practical school on another man's money. After several years of good hard work, an assistant superintendency may be the reward, and the man will then be in shape to 'deliver the goods.' At best, the practice of this profession means to an average man the relinquishment of practically all home ties and intellectual environment. It means years spent in some out-of-the-way place, working shoulder to shoulder with, and in positions subordinate to, uneducated and unintelligent men, who have learned how by years of experience. It precludes the possibility of early marriage, and eliminates any idea of planting your roof-tree for years after graduation. The ultimate aim of most engineers is probably to become consulting engineers, so as, at last, to make a comfortable home amid pleasant surroundings a possibility; but remember, that only a few 'arrive,' and the path is a rocky one.

So I say, that no man should take up mining as a profession, who is not big, and strong, and healthy, and willing to work with his hands, who is not willing to renounce the comforts and pleasures of home life, who is not willing to associate on equal terms with men less well endowed than himself, who cannot be meekly obedient to his intellectual inferiors, and who has not something of a roving disposition. If he has all these qualities, and will stay with it, mining is a good business for him. He must be prepared to live and work in high altitudes, in tropical fever-swamps, in desolate mountain ranges, and on desert wastes, and is at all times subject to the beck and call of capitalistic employers who regard him at best as an efficient machine, a link in the dividend-producing system. Of course, the first requirement in this, as in any other business, is intelligence. Without that the game is hopeless in any walk of life. But open the boy's eyes before he decides to make this his career. Don't feed him with a lot of balderdash, which will warp his judgment and pervert his decision. If possible, give him a summer's work in some mining camp before he goes to college, as it is only fair that he have some conception of what the work is that he is choosing for his life's effort, and this about the only profession that the average boy adopts by hearsay. He sees and understands something of the life and sphere of activity of men in other professions, such as doctors, lawyers, architects, electrical and mechanical engineers—in fact, almost every other profession open to him except mining, and this is in itself reason enough why, as the knowledge he is able to get from books and magazines is necessarily somewhat unreliable, the literature sent out by the colleges of mining should be accurate and conservative in all of its statements.

ONE OF THEM.

San Francisco, May 8.

A Disclaimer.

The Editor:

Sir—I will be glad to have enough space in the columns of your journal to call the attention of mining engineers and the public interested in mining, to the methods used by the agent of the Eastern Mining Company, a Manila, P. I., corporation, to dispose of stock in the United States, in connection with which my name, and that of Mr. H. D. McCaskey, formerly Chief of the Mining Bureau of the Philippine Ids. and now on the U. S. Geological Survey, is being used.

After three years service with the Government of the Philippine Ids. as Geologist of the Mining Bureau, I resigned to take the management of the Eastern Mining Company. I was convinced that the property was worthy of further development, and Mr. A. Heise, the president of the company, was sent to the United States to raise a larger amount of money than seemed to be available in Manila. His mission was to put before capitalists a business proposition, to raise funds from the sale of the capital stock which he was authorized to sell, and it was naturally presupposed that only legitimate business methods would be used.

On account of the distance, principally, and possibly through design, it is only recently that I have learned that there are being inserted in the papers of the United States, large advertisements which are full of misleading and false statements regarding the property of the Eastern Mining Company.

Some of these are the following:

"Sixteen quartz claims, all demonstrated perfect title, with U. S. patent, and 39 placer claims of 800 acres, averaging 35 cents per yard."

"Over $8,000,000 in sight on quartz claims."

"$100,000 have been spent in development work in the last five years."

"A 5-stamp mill actually at work, producing over $3,000 per month at the present time."

These assertions are gross exaggerations and in some cases are absolutely false.

The number of claims and the acreage is sufficiently accurate, but hardly a dollar's worth of work has been done on the placer ground, and it is wild imagination to place a value of 35 cents per yard on the ground.

There is *not* "$8,000,000 in sight on the quartz claims." The figures in my report to the directors are $100,000.

The amount of money spent in development work has mysteriously increased fourfold.

There is no "5-stamp mill actually at work on the property." A small (iron frame, 800-lb. stamps) mill was installed about two years ago and produced bullion to the total amount of about $5,000. It was a poor machine at best and was poorly erected. It broke down repeatedly, and its final collapse took place long before the person responsible for the advertisements left Manila for the United States, and he was, and is, perfectly familiar with the fact that it has not been running for over six months, and never did run but for a few weeks

at a time. There was no accuracy in the methods of operation, and all the operators were entirely ignorant of mining and milling, so that calculations of value per ton and the rate of extraction are founded on thin air.

The agent of the company who is responsible for such methods of selling stock was sent to the United States to raise funds by legitimate means, and it is entirely on his own responsibility that he has used such methods. The board of directors has voted its disapproval and taken steps to end such proceedings, and I, personally, have severed my connection with the company. In order that the true conditions may be learned by anyone interested, I have published an abstract of my report on the property, in the March number of the *Far Eastern Review*, a semi-technical journal of good standing, here in Manila.

Beyond the figures in that report and the statement of general conditions there, I can assume no responsibility.

A. J. EVELAND.

Manila, P. I., April 11.

Confidential Information Safeguarded.

The employees of the United States Geological Survey are apt, in the course of their work, to become possessed of information in regard to properties or regions examined that may be of a confidential nature and such as would not have been acquired had they not been engaged in such work. This is particularly true of geologists who make investigations relating to mines and mining districts. Property owners usually communicate freely all the geological facts in their possession to the examining geologist, because they realize that, although part of the information is confidential, such data will not be published by the geologist without the consent of the proper parties, except as a basis for conclusions and generalizations.

Those who have their property examined by officers of the Geological Survey will be interested to know that all scientific employees of the Geological Survey are requested to sign an agreement, in which the geologist pledges himself to bear in mind the fact that his position may enable him to learn facts that are not known to the general public, and that when such facts are of a confidential nature he will refrain from any mention of them that would tend to violate such confidence. He further pledges himself not to testify in any mining litigation before the United States, State, or Territorial courts during his employment on the Survey, and for three years after the termination of such employment not to act as expert in mining litigation concerning properties in any district in the United States upon which he has made any report or part of a report under the employ of the Survey, provided that this restriction shall not apply in any case where ten years shall have elapsed since the completion of the field work upon which any such report was based.

It will thus be seen that the Geological Survey tries in every possible manner to safeguard the interests of those with whom it has to deal, and that owners of property need have no fear that confidential information will be divulged.

THE use of mica for stove windows formerly constituted the principal demand for sheet mica, but this has decreased somewhat in recent years. The increased use of sheet mica in incandescent gas lamps and for miners' lamps has kept up the demand for glazing grades, so that whatever comes into the market is quickly bought. Sheet mica is also used to some extent for phonograph diaphragms and in various small novelties.

Rail Joints.

A track, being weakest at the joints of the rails, where they are deprived of their vertical strength, has of course a greater tendency to bend at those points; and this bending produces an irregularity in the movement of the car, especially if it be heavily loaded, which is detrimental both to the car and to the track. Moreover, that end of the rail upon which a wheel is moving bends more than the adjacent unloaded end of the next rail, so that when the wheel arrives at this second rail it imparts to its end a severe blow, which injures it. Thus the ends of rails are exposed to far more injury than other portions.

Numerous devices have been tried for strengthening the joints of the rails with a view to preventing this bending entirely, or at least of causing the two adjacent rail-ends to bend equally and together, so as to avoid the blows alluded to. None of these joint-fastenings, known as chains, fish-plates, wooden blocks, etc., have proved entirely satisfactory.

Much of the deficiency ascribed to fastenings is, however, really due to want of stability in the cross-ties at the joints, and more attention must be given to the latter before an efficient fastening can be attained. Observation shows that when the joint-ties are firmly bedded, almost any ordinary fastening will (if the joint is placed between two ties instead of resting on the tie) do well. On the other hand, if the joint-ties are so insecurely bedded as to play up and down half an inch or so under a heavily loaded car, the strongest and most effective fastening becomes inoperative. All the parts will become gradually loosened, warped, bent, or broken.

If the joint is placed between the ties it is called a 'suspended' one, if upon a tie a 'supported' one. Experience has shown the superiority of suspended joints over the supported kind. Long fastenings (as fish-plates) possess but little superiority over short ones where the track is not kept in good repair, for the greater bearing of the former, although imparting an increased firmness to a good track, in a bad one becomes converted into a powerful leverage by which it accellerates its own destruction. An element in the injury of joints is the omission of a proper fastening at the middle of the rail. The rail should be so firmly attached to the cross-ties at or near its middle point, as to compel the contraction and expansion to take place equally from that point toward each end. It is difficult to accomplish this perfectly. Attempts heretofore made have failed.

Under the extremes of temperature in the United States, steel expands or contracts 1 part in 916, consequently a rail 20 ft. long will vary fully a quarter of an inch in its total length. Besides, the rails are liable to move or creep bodily in the direction that the loaded cars move, especially if that direction is down-grade. By this process the joint-fastenings are exposed to additional strain and derangement. Rails appear to become slightly elongated at their ends by use, and this renders a full allowance for expansion and contraction the more necessary.

NEW SOUTH WALES coal is in high repute in the Philippines, and practically holds the market. The importations are increasing, and the opinion is expressed that, so long as the present quality and prices are maintained, Japanese coal will be unable to compete with the New South Wales coal. When more activity is displayed in railway construction, and more lines open to traffic, it would appear reasonable to expect increased importations from New South Wales, and certain deliveries at the southern extremity of the islands.

Water Resources of Nevada.

Written for the MINING AND SCIENTIFIC PRESS
By HENRY THURTELL.

To one who lives among the green hills and abundant vegetation of the Middle States, the word Nevada conveys an impression of excessive dryness. No other State, except Arizona, bears such a reputation for lack of moisture. The traveler on the train looks out upon brown rolling hills and ragged lava-strewn mountains. The hills are not crowned with stately trees, but mountain and plain are alike covered with the aromatic sagebrush. The landscape gives little hint of the real bounty of nature in this apparent desolation. Under these gray old bushes grow the most fragrant and beautiful wild flowers. Falling down these rugged mountain sides are little streams of water fed by the melting snows upon the summits. Locked in these brown old hills are seams of ore carrying gold, silver, lead, and copper.

Carson River at Empire During Flood.

The streams of Nevada are small compared with the rivers of other States. The water nearly all runs toward the interior and empties into shallow lakes to evaporate there. The Humboldt river rises in the Ruby and Independence mountains in Elko county and flows west to the sink near Lovelocks. Beginning at the starting point of its longest tributary and following its devious course to its confluence with the other streams, thence to the sink of the Humboldt, the total distance is a thousand miles. The pathfinders that crossed from the Missouri river to California in the 'prairie schooners' of the bygone days of '49, followed the Humboldt river for hundreds of miles. Along its banks the stock of the emigrants found grass and rested after the wearying journey across western Utah and eastern Nevada. Along this emigrant road can be picked up old irons from ox-yokes and wagons, and here and there is to be seen an unmarked grave, a mute reminder of the tragedies of the desert. Along this road in early days, lurked savages ready to rob and murder the unwary. In the Lovelocks valley, during recent leveling for cultivation, land that was once covered by water of the Humboldt lake has been disturbed. Here several skulls were uncovered and at least a dozen gunbarrels. No record exists of any battle between belligerent tribes of Indians, or between whites and Indians, that took place near this point. Here, however, is such record as Nature herself was able to preserve of a tragedy unwritten and unknown. Here, perhaps, men worn out with travel or badly wounded crawled into the tules along the edge of the lake to rest or to hide from their enemies. This river, with its tributaries, drains nearly 11,000 square miles of land. The average annual rainfall is about 12 inches. The stream actually irrigates at present about 300,000 acres of land.

The Walker river rises among the high mountains on the western side of California and flows northeast into Nevada, watering on its way Antelope valley in California and Smith and Mason valleys in Nevada. It then rounds the north end of the Walker River mountains and turns south, emptying into Walker lake in Esmeralda county. It waters 50,000 acres of land and on both of its forks offers opportunity for power development. It flows through the Walker River reservation, first opened for settlement on October 29, 1906. The land in this reservation suitable for agricultural purposes, was nearly all reserved for the Indians and allotted to them in small farms. The tract opened for entry was mainly mineral land and on the day of the opening when the gun on the summit of the mountain gave the signal, there were 3,000 men waiting to stake the coveted ground. Old men and young joined in the rush, women too, with the fever of adventure in their blood; men on horseback, on foot, in automobiles, staid farmers who had lived within twenty miles of that reservation for forty years and men who had crossed a continent to take this chance, were there. Upon the reservation were several streams of water hitherto unappropriated; a right to water is initiated by an application to the State Engineer's office at Carson City. On the date of the opening, long before the hour of noon, a waiting line of men with applications prepared stood before the door of the Engineer's office. These applications were treated as if received simultaneously and their priority determined by lot.

Carson River During Flood.

The Carson river, like the Walker, rises in eastern

California and flows east and north into Nevada, watering between fifty and sixty thousand acres of land in Douglas, Ormsby, Lyon, and Churchill counties in Nevada. This river takes its name from the famous scout and guide Kit Carson, who accompanied the intrepid Fremont on his journey across Nevada along the Humboldt, Carson, and Walker rivers into California. The Carson valley, in Douglas county, was settled by the Mormons early in the 'fifties, but these settlers were later recalled to Utah by Brigham Young, then president of the Mormon church. This is an exceptionally fertile valley and is well cultivated. The east and west forks of the Carson both offer opportunities for power development that seem now about to be utilized. The river empties into the Carson sink in Churchill county and evaporates. When the Comstock mines were pouring out ore of phenomenal richness, it was hauled in cars to the Carson river and on its banks great mills were erected. The river furnished the power and the water necessary. Many of these mills are standing yet. Some are doing a little work; others have been torn down and moved away. The recent flood has torn out some of the old dams while nearly every bridge, from one end of the river to the other, was either utterly wrecked or put out of business.

The Truckee river is the outlet of Lake Tahoe and flows through Placer and Nevada counties in California and Washoe county in Nevada into Pyramid lake in Washoe county. Its total length is about 125 miles and in that distance the river falls nearly 2,500 ft. It is being used to generate power at five different points. At each point nearly the total available flow of the river is utilized and about 350 ft. of fall has been secured. About 7,000 h.p. is being generated and is being transmitted for lighting purposes to Truckee, Verdi, Reno, Carson, Virginia City, and Sparks. This power runs the paper-mill at Floriston, supplies energy for the pumps at Virginia City, for the hoist and mill at the Rocky Hill mine, for the hoist at Como, and it is now being transmitted to Yerington for use in the hoists for the copper mines there. The Truckee river, with its tributaries, waters about 50,000 acres of agricultural land and is not now over-appropriated. The Reclamation Service has constructed a great canal capable of diverting 1,400 sec.-ft. of water from the Truckee to the Carson, a distance of about 31 miles. This water will be stored in a great reservoir and used on 200,000 acres of land around the Carson sink in Churchill county. The Truckee river is almost an ideal trout stream. It is thoroughly stocked with the best of fish and sportsmen come from afar in order to enjoy the season of sport along its banks.

The Muddy river rises in springs in Lincoln county and flows south and east to its confluence with the Virgin about 20 miles north of the junction of that stream with the Colorado river at Rioville. The Muddy is only 40 miles long; in an Eastern State it would be called a creek. It carries about 50 sec.-ft. and this serves to water 3,000 acres of valuable land. This is an almost tropical climate; figs, apricots, and other fruits, as well as vegetables, are grown with entire success. The river is unique in that so large a volume of water comes entirely from springs in low mountains, in a country of slight rainfall. The moisture that feeds these springs must come from melting snow on mountain summits a hundred miles away.

The Reese river rises in the Toyabe and Shoshone ranges in Nye county and flows north toward the Humboldt. At one time it undoubtedly emptied into the Humboldt river at Battle Mtn., but now none of the water of the Reese ever reaches the Humboldt except in exceptional seasons. The stream is largely appropriated and irrigates 20,000 acres. On its tributaries it offers advantages for power transmission. The upper end of the river passes through a highly mineralized region where many valuable mines are now being worked. The town of Austin, near the Reese river, has been often mentioned as the ideal mining camp. The town is supplied with a good water-system. From her mines millions of treasure have been taken. The district, too, was settled more than forty years ago by a class of people that would have done credit to any country in which they might have made their homes. The old residents of Austin are distributed all over Nevada and California; wherever found they are law-abiding, industrious, progressive citizens.

The Quinn river in Humboldt county flows south and west and empties upon the Black Rock desert. It waters 10,000 acres. The river has a drainage area of about 4,000 square miles. The desert upon which it empties is worth more than a passing notice. It is the real thing. In the spring much of the surface is covered with water; later in the summer this water evaporates, leaving a dry hard surface across which one can drive in any direction with a loaded wagon. The surface is so hard and smooth that a carriage-wheel leaves scarcely a scratch. Not a spear of grass or shrub of any description breaks the monotonous landscape. Not a living creature, bird, beast, or reptile, seems to venture here. It is the picture of desolation, lonely beyond words, an unchanging, unpitying, silent, inscrutable waste. The most aggressive and enduring of creatures—man himself—dominant, unyielding, and resourceful, has laid down his life in an attempt to cross this desert without adequate preparation. It is 50 miles long and 20 miles wide. If there is a spot on earth that God forgot, it is this Black Rock desert of Nevada.

There are in Nevada scores of smaller streams watering limited areas. In many places one man alone owns or controls all the land capable of being watered by a stream. Here he can raise sufficient hay to feed, during a hard winter, a large herd of cattle or sheep, and during ten months or more of the year his stock finds free pasture upon the adjacent public land. The different mining companies in the State, in securing water for the milling of ores and for domestic purposes, have wrought little short of miracles.

Virginia City secures water from Lake Marlette, 30 miles away. The water is brought in a 10-in. pipe and at Lake View, where the pipe-line crosses the Virginia & Truckee railroad, it is nnder a static head of 1,680 ft. The pipe is nine-tenths of an inch thick. This system is said to have cost $1,000,000 to construct, but it has furnished for Virginia City an abundant supply of pure water. An apparent anomaly is the use of this water at high pressure in the Consolidated & California mine to pump water from the lower levels up to the Sutro tunnel, whence it is discharged by gravity.

The town of Ely in White Pine county, is being supplied with a modern system of water-supply and distribution. The water of Murry creek, which now flows through the town, is being diverted into a pipe and will soon be supplying each house in a convenient manner. The concentrator being built at McGill's, will be supplied with water from Duck creek and springs upon the McGill ranch. There is no donbt concerning the abundance of this water-supply to meet the needs of mining and smelting.

The older mining camps, like Pioche, Eureka, and Austin, all have been supplied with a fairly effective water-service sufficient for their needs, for domestic and milling purposes.

Tonopah derives her main water-supply from Rye-

patch, 14 miles west of town. A range of mountains lies between the wells and the town. The water is pumped to a height of 700 ft., where it is stored. From the reservoir it is carried by gravity to the consumers. The price charged by the water company seems high, but so is the expense of pumping; this results in a much smaller use of water than is usual in cities. Leaving out of consideration the water served to the mines for boilers and other purposes, and that used in mills, it is unlikely that more than ten gallons of water per day per capita is used in Tonopah for all the different household purposes. The Tonopah Mining Co. has a mill in operation at Miller's siding, 11 miles west of Tonopah. The water for milling purposes comes from adjacent wells.

Goldfield has probably gone farther to secure water than any other mining camp in the State. It has been able to secure water sufficient to supply absolute necessities from different wells that are all within a radius of six or seven miles of the town. These wells cannot yield more than 90,000 gal. per day, and Goldfield has 18,000 people dependent upon this water for drinking and domestic purposes. This means five gallons per day per capita, and this water, too, is not all used for drinking and domestic purposes. Some is used in the mines and mills, and some for the watering of stock. The people of Goldfield might easily be forgiven if they lost the habit of drinking water. Various substitutes have been used with entire satisfaction. During the last year a company was organized to gather up the water of all the springs around Mt. McGruder, and pipe the water to Goldfield. A supply of from 200,000 to 300,000 gal. each day will be secured from this source. The pipe-line is now nearly completed. It is 35 miles long, and this supply of excellent water will add greatly to the comfort and good health of the residents of Goldfield.

Rhyolite has three different water-systems, each distributing the water through pipes to its patrons. Probably 150,000 gal. per day is being supplied. Sufficient water can be obtained at a number of points along the Amargosa river to mill the ore of the Bullfrog mines. This is a stream called a "river" by courtesy only. At high water 100 sec.-ft. flow down its channel for 150 miles. At low water the channel is dry for long stretches. The water sinks and reappears many times. The stream runs southwest until it rounds the south end of the Funeral range of mountains; then it turns north and loses itself in the mysterious Death Valley of California.

The new discoveries of gold and silver in Nevada seem to be nearly all in low hills, with the result that many valuable finds have been made at a distance from the starting point of springs and streams. Water is at a premium, therefore, in many new camps. In Tonopah it was sold at $1.50 per barrel for nearly a year after the camp started. In Goldfield, it was sold at about the same price for a year or more. In Manhattan, it was sold until recently at $1 per bbl. In Greenwater, it sold for months at $10 per bbl., and was hard to obtain at any price. In Wonder, water is being piped from Bench creek. It is sold, at the end of the pipe, for three cents per gallon.

Many new camps have sprung into existence during the last year: Wonder, East Gate, West Gate, Middle Gate, and Hercules in Churchill county; Seven Troughs, Vernon, Rosebud, and Goldbud in Humboldt county; Lander and Tenabo in Lander county; Black Horse in White Pine county; Blair and Dutchman in Esmeralda county; Lee and Echo, near the California-Nevada State line; Round Mountain and Shoshone in Nye county. All are in the foothills and must get their water-supply from springs or creeks, in some cases, many miles away. In the valleys in the northern end of the State and in some of the valleys in the south, water can be obtained from the ground by digging a shallow well. In the irrigated valleys, the ground-water is only three feet below the surface in many places, and is seldom more than eight or ten feet. The top of this ground-water is not a plane and is not horizontal. It undulates much as does the surface itself. The mines themselves often afford a supply of water. The Virginia City mines have so much water in them that the pumping is the main expense of operation. The mines at Tonopah, however, have yielded, up to the present time, no water in quantity.

There are areas in Nevada as large as four townships, where no living water can be found. These spots are, however, rare. A prospector who knows the country can, with burro and pack outfit, go anywhere and maintain himself. Some of the stories of men perishing from thirst in Nevada are true. The seasoned prospector keeps well in mind where he will next connect with water. Flour or bacon or beans or coffee, he can do without if need be; but water he must not be without for any length of time.

The brilliant sunlight, the gray lonely plain, the dark ragged mountain, have their own peculiar charm when seen under conditions of reasonable comfort. If, however, the traveler be worn out and discouraged, hard-pressed for water, and uncertain where he will obtain his next supply, then the landscape has for him no beauty. It is a parched and arid plain. The gold locked in its hills has for him no lure. What he wants is water and he would almost give his immortal soul for the chance to lie down beside a sparkling brook and drink and drink.

It has long been known to scientists that good glass can be made by melting quartz crystal, and so cooling it as to prevent re-crystallization, but as quartz glass was obtainable only in the form of minute globules by means of an expensive process, the knowledge has never been turned to practical account. While experimenting recently with quartz in the electric furnace, there was incidentally discovered a method of producing quartz glass in larger quantities, obtaining perfect plates of it six inches long and two inches wide. Possessing certain remarkable and valuable properties peculiar to no other kind of glass, this substance is actually worth its weight in gold, and the importance of the discovery was great. Expansion of quartz glass when heated is imperceptible, and cold water may be poured over it when white hot without breaking it. Ordinary glass refuses to transmit the ultra-violet rays of the spectrum, while quartz glass transmits it freely. It is the best material for camera and telescope lenses, owing to its exceeding clarity, and its use is expected to widen the scope of astronomical research.

Newfoundland.—The colony has long been known to be rich in minerals, but thus far only copper, hematite, and pyrite mines are being operated on a large scale. Copper has been worked more or less extensively for about 50 years, and the annual output of late is about 70,000 tons, valued at $360,000. Hematite is exported to the extent of about 750,000 tons, valued at about as many dollars. Iron pyrite is sent away to the amount of 50,000 tons, valued at $240,000. The average value of mineral export for the past four years is $1,377,374, lesser products of barite, slate, talc, etc., being included. For some years past boring for coal under Government direction has been carried on over an extensive area in the interior, where the existence of carboniferous deposits has been proved, but thus far no substantial progress has been made finding any of commercial value.

The Lluvia de Oro District, Mexico.

Written for the MINING AND SCIENTIFIC PRESS
BY R. H. BURROWS.

This district, through its geological associations, is one of the most interesting in the Sierra Madre. It is situated in the western part of the State of Chihuahua, in the mining district of Andres del Rio and about five miles from the Sinaloa line, as shown by the accompanying sketch map of the region (Fig. 1). The approach

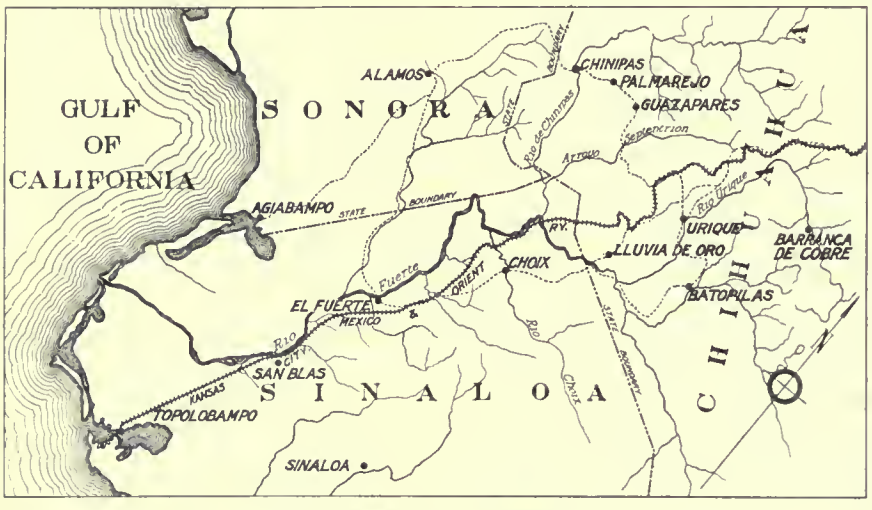

Fig. 1. Map of Part of Mexico.

from the Pacific side is by sea to Topolobampo, thence by the Kansas City, Mexico & Orient Railway to El Fuerte, finishing the trip with two days on muleback from El Fuerte to Lluvia de Oro. The traveler coming in by way of El Paso, goes westward from the city of Chihuahua over the K. C., M. & O. Ry., to its present terminus at Aguatos, from that point proceeding on muleback five days to Lluvia de Oro. The latter route is generally preferred, as it lies through the highlands of the Sierra in a region where the temperature is always cool and pleasant, and for the further reason of its communication with El Paso, which for the majority of people is the most convenient approach to the northern part of the Republic. Eventually, with the completion of the K. C., M. & O. Ry., this camp will have railroad connection east and west, as the main line of the railroad is surveyed within five miles of the Lluvia de Oro mine.

The circumstances connected with the discovery of this mine are sufficiently curious to merit narration. The existence of gold in the neighborhood had been known through the fact that Indians from that vicinity had, for a long time, brought in rich pieces of gold quartz to sell and trade at the stores, but, conformable to the Indian character, they had resolutely declined to reveal the locality from which the specimens were derived. Knowing these facts, a Mexican merchant, named Bernardo Garcia, established a small supply store in the village of Realito, which he supposed to be not far from the mine, it turning out afterward to be about six miles distant.

With the ostensible object of trading with the Indians and travelers between Batopilas and El Fuerte, but with the secret purpose of arriving at the knowledge of the Indian treasure house, Señor Garcia plodded along at Realito for several years, following up clew after clew, but without avail, until he took into his employ an individual named Espiridion, who joined native cunning with an intimate knowledge of the Indian character. Stimulated by the promise of reward, Espiridion wormed his way into the confidence of the Indians, frequently joining them in their drunken orgies, until at last they came to regard him almost as one of themselves. While it is hardly probable that Espiridion had any clear plan outlined in the method of his search, the fact remains that he persisted in cultivating the Indians, trusting, no doubt, to some chance accident to reveal the whereabouts of the coveted mine. Chance at last favored him; happening to be present at one of their periodical carousals, and feigning to be asleep or dead drunk, Espiridion caught a few words which caused him to listen with all his ears. Two of the individuals, forgetting their usual caution, or thinking it unnecessary under the circumstances, let fall certain remarks, and although very meagre, enough reached Espiridion to give him a clew to the location of the mine. A certain gulch was spoken of, and a few days afterward Espiridion took occasion to wander that way. Arriving near the head of the gulch, he found pieces of quartz containing visible gold. By following this he was led to the base of a limestone cliff, and cropping out of its face stood the quartz body that had dispensed its treasure of gold to the Indians, and which has since become famous as the Lluvia de Oro mine. This then was the mysterious mine and it far exceeded all expectations in richness and quantity of ore. The delighted eyes of the discoverer encountered a face of quartz, 10 ft. wide and 15 ft. high, with visible gold all through it; some of the

Fig. 2. Mill at El Chorro.

specimens broken off being loaded with the precious metal. Discovered and located in 1900 by Garcia, it was bought two years later by the present company for $1,750,000.* Garcia named the mine Lluvia de Oro,

*U. S. currency. We use *peso* for the Mexican dollar.—Editor.

which means 'Shower of Gold,' a name that has been abundantly justified by the production of the mine, which since the installation of the 20-stamp mill, has maintained an output of $80,000 per month.

The topography of the area under consideration, consists of a high ridge sloping southeast to the Fuerte river and northwest to the *arroyo* of Bahueraehic. The mine is situated on the southeast face and near the top of this ridge; the mill being at El Chorro (Fig. 2), on the Fuerte river. The difference in altitude between the mine and the mill is about 5,000 ft. and the distance is five miles; the ore being packed from mine to mill by mules and burros. This primitive method of transportation, however, will soon cease, as the company is at present getting ready for the installation of a cable tramway.

The orebodies occur in a bed of limestone, which crops out as a bold cliff along the east face of the ridge, and which has suffered extreme faulting and fracturing, the mineralized area having been raised about 2,500 ft. by the intrusion of a body of diabase, the latter now forming the underlying rock of the district. The uplifted portion is about five miles long, extending from the great vault near the Lluvia de Oro mine on the southwest to the *arroyo* of Balojaqui on the northeast, where the limestones dip under Gloriapan mountain. The annexed geological sketch is a partial section across this area, parallel to the outcrop of the sedimentary beds. Occupying the summit of the ridge and lying on the limestones is a massive dark-colored andesite of rather fine grain and generally much altered. This andesite is the remains of a flood of lava that was originally 1,000 ft. thick, antedating the great deluge of volcanic material that built up the Sierra Madre. Both of these formations at one time covered the area in question, but the extreme elevation and fracturing to which they were subjected having rendered them an easy prey to erosion, the volcanic material has been entirely carried away, and in some places the massive andesite has been eroded to such an extent as to expose the underlying limestone.

The upper member of the sedimentary series consists of 250 ft. of massive gray limestone, which is quite pure except where changed by later mineralization. This is the most prominent part of the formation, occurring as a conspicuous outcrop along almost the entire extent of the ridge. Directly underneath this is a layer of fossiliferous limestone, 20 ft. thick, crowded with shells of *rhynconella lacunosa*† and what appear to be *belemnite* pens; the latter, however, being too dim to identify. The finding of these *rhynconella* proved to be most important in the determination of the age of the beds, as up to this time the question had been in doubt, it having been generally supposed that the limestones near the west coast of Mexico corresponded to those that had been identified as Cretaceous along the Pacific border, farther north. As the above-mentioned fossil is characteristic of the Jurassic period, these limestones, therefore, may be determined as such and consequently lie in the same geological horizon as the limestones of Catorce.

†Determined by Jose G. Aguilera, Director of the Mexican Geological Institute.

Below the fossiliferous layer is found 300 ft. of thinly bedded limestones, passing at the base into mixed slate and limestone, the last formation 100 ft. thick and resting in turn upon 100 ft. of sandstones or tuffs in thin beds. The lower members of the strata are not always visible, being sometimes obscured by talus from the overlying formations, or hidden by faulting. The entire series of beds, about 770 ft. thick, may be observed on the Baltimore claim, two miles north of the Lluvia de Oro mine. The sedimentary beds, as far as could be seen, were conformable throughout. Immediately beneath the sedimentary beds, being continuous down to, and under, the Fuerte river, the diabase intrusion shows a thickness of at least 4,000 ft. It is probably contemporary with similar laccolitic intrusions near Urique and at Batopilas. Above the town of Urique, it forms the country rock of some of the rich veins, rising fully 2,000 ft. in the walls of the *barranca*, while at Batopilas it occupies the lower portion of the *cañon*, forming the country rock of the unique mineral deposits of that camp. The diabase probably rests upon a foundation of granite, as a few miles to the west of Lluvia de Oro, the granite is seen to rise while the diabase feathers out to nothing, and the sedimentary rocks rest immediately upon the granite.

Later than the diabase and finding expression in the shape of dikes that penetrate all the other rocks of the district, eruptions of rhyolite are prominent, protruding through fissures formed subsequent to the diabase intrusion. The most notable of these dikes is that which

Fig. 3. Village of Lluvia de Oro. Cliff to Right Marks the Great Fault.

occupies the fissure of the great fault directly west of the Lluvia de Oro mine, traversing the country as a conspicuous wall 20 to 50 ft. high for a distance of at least four miles, extending from the gulch below the village of Sierra northward into the *arroyo* above Bahuerachic. Opposite the mine offices, and forming part of the great cliff, the rhyolite comes up again through the same fissure for a short distance, there being a break in the continuity of the dike between this point and the gulch below the village of Sierra. On the flanking ridge extending from the Lluvia mine toward El Chorro, is another rhyolite outcrop forming a sharp peak. Whatever the country rock of the mining camps of this part of the Sierra Madre, the presence of rhyolite dikes may be noted almost without exception, in fact, it is the only rock that may be considered as common to them all.

After the intrusion of the diabase, the area in question was elevated, causing a tension that fractured the superincumbent rocks, culminating on the west side in the profound fault which limits the uplifted area in that direction, and on the east side by a steep monocline, which dips under the Balojaqui *arroyo* and passes under Gloriapan mountain. The great fault on the west side may be traced from a point above the Fuerte river, northward along the foot of the high cliff near the Lluvia village, through the village of Sierra and thence to Bahuerachic *arroyo*, a distance of over six miles, the line of the fault beyond Sierra being marked by the conspicuous rhyolite dike spoken of above. The fault-scarp is plainly shown in the accompanying photograph (Fig. 3), the cliff being on the downthrow side of the fault.

While this appears strange, it may be explained by the extreme shattering of the rocks on the upthrow side, which, together with their elevation, caused them to be more easily disintegrated; the rocks on the other side, not being fractured and remaining at the normal elevation of the surrounding country, have resisted the tendency to erosion. The relation of this fault to the rocks on either side, may be seen in the accompanying section (Fig. 4), which represents one and a half miles in length, from northeast to southwest, through the Lluvia ridge.

The outcrop of the sedimentary beds consists of a nearly continuous cliff following the east side of the Lluvia ridge. It will be seen from the section, however, that the continuity of the beds is much disturbed by a number of minor faults that occur along the face of the cliff, these being most numerous in the neighborhood of the Lluvia de Oro mine, and graduating from shattered zones without any displacement, to faults of over 500 ft. These minor faults are roughly parallel to the great fault described above, having a general northwest to southeast direction.

As might be expected in such a disturbed region, the rocks in many places have undergone considerable alteration. Along the trail, directly on the top of the hill overlooking the Lluvia village, the limestone has been changed into a pure white marble. The most widely distributed product of alteration is epidote, which is scattered throughout the rock in patches from an inch in diameter up to several yards across. These areas of epidote are not confined to the limestone, but also occur in the eruptive rocks of the vicinity, although in lesser quantity than in the limestone. Patches of green garnet are also found, which are almost indistinguishable from the epidote. The most important alteration product, however, both in an economic sense and in the quantity of material involved, is the quartz of the region, which forms the matrix of the gold, constituting the orebodies of the district. All of the quartz bodies found up to this time and worthy of the name, have been confined to the limestone; stringers of quartz occur in the eruptive rock both above and below, but are altogether negligible with reference to their ore-bearing capacity.

As an ore deposit, Lluvia de Oro is most unusual. It is a metasomatic deposit of quartz within the limestone; the orebodies occurring in irregular lenses, which terminate abruptly, their long dimensions being transverse to the bedding planes of the limestone and roughly parallel to the fault-system of the district. Lead and zinc deposits in such form are common, but this is the only instance of a gold-quartz occurrence under such conditions that has ever come to my notice. The Mercur ore deposits consist of gold ore in limestone, but they form continuous bodies, occupying the contact between an intruded dike and the limestone, having little in common with the deposits of Lluvia de Oro, which I consider unique.

The fractures of some of the minor faults shown in the section were carefully examined as possibly favorable places for the deposition of ore, but no quartz was found along these planes. After examining a number of quartz exposures in the neighborhood, it was found that the mineralization occurred in zones of sheeting, where the limestone had been subjected to extensive fracturing, but without making any clean-cut fissure. The ore occurrence at Lluvia mine is undoubtedly in such a zone, and other outcrops of quartz were noted under similar conditions. The fracturing of the beds passes into the overlying eruptive, but the quartz bodies end before the limits of the limestone are reached, nothing but narrow stringers of comparatively barren quartz being visible in the superjacent rocks. Small stringers of quartz also occur in the diabase underneath the sedimentary rocks, but appeared to be absolutely barren. From these observations it would appear that the orebodies are to be sought in zones of fracture or sheeting in the limestone, the indications being decidedly unfavorable toward prospecting outside that formation.

The ore is a solid, gray, cherty quartz, containing fine black specks of mineral, with pyrite making its appearance sparingly in the deeper parts of the mine. Average assays from the lower orebody give results of 3 oz. gold, with 30 oz. silver, per ton. The ore near the surface ran much higher in gold, with a smaller proportion of silver. Up to the time of my visit, the milling process had been that of pure amalgamation, the tailing being stacked for future cyanidation. The company is now preparing for the installation of the latter process, which, together with a proposed increase in crushing capacity, will materially swell the production of the mine.

While the Lluvia de Oro mine is the only one in the district that is being profitably worked at present, there is no doubt that intelligent prospecting along the line of the limestone outcrop will succeed in developing other bodies of pay-ore, as the geological conditions are precisely the same; in fact, a small amount of rich ore was found on the claims of the Presidente Mining Co., five miles from the Lluvia mine. Systematic prospecting is going on at two points on the mineral belt, one at the northeast end by the Presidente Mining Co., a Milwaukee organization; another midway along the outcrop, by J. S. Towne, of the Campañia Metalurgica de San Luis Potosi, who is working two claims under bond.

Development of this region has been retarded by the existence of a prospecting concession, covering 900 square kilometers or 348 square miles, including the entire camp of Lluvia de Oro, together with much promising ground at other points. This concession gave the holders the

sole right to locate claims during the period of the concession, which was three years from September, 1903. This period, however, was extended six months, and should have expired in April, 1907.

Labor is fairly plentiful, at prices ranging from 1.50 to 2.50 *pesos* per day. Timber and boards are brought from the pine forest, eight miles north; wood for fuel being derived from the scrub oak that grows everywhere in the vicinity. The present mill is run by steam-power, but near-by the Fuerte river has considerable fall, which it is proposed to utilize in the generation of electric power to supply both mill and mine.

SIBERIAN COAL AND IRON.—Large deposits of anthracite coal have been discovered in the Russian territory of the Orenburg Cossacks. The depth is only 56 in., and the vein extends about 133 miles north and south, and at about the same distance in a southerly direction from the great Siberian railroad. The great value of this discovery lies in the following facts: (1) The proximity of the coalfields to the Ural iron and steel industry, which is at present mainly dependent upon wood and charcoal for fuel, and therefore otherwise incapable of further expansion. (2) In view of the probable early exhaustion of the South Russian iron ore mines, estimated to take place in about 30 years, the Ural district is destined to become the greatest producer of iron and steel in the Russian Empire; the above newly discovered coalfields will therefore become of inestimable value to the district. (3) The discovery in the neighborhood of the coalfields of deposits of brown hematite, an ore well adapted for smelting purposes.

MINERALS IN CHINA.—A report from Vice-Consul Rea Hanna, of Amoy, gives an American mining engineer's account of some mineral deposits in Fukien Province, China. It is stated that a mountain of magnetite iron ore a mile long and three-fourths of a mile wide exists near Amoy which is estimated to contain 10,850,000 short tons. Limestone, galena, kaolin, and zinc-blende deposits are also reported in the same neighborhood, while the natives bring in samples of rich antimony ore and graphite. The Consul adds that if the Chinese Government will enact mining laws which will make the investment of foreign capital and the introduction of foreign enterprise a possibility there appears to be a splendid field for American engineers and capitalists.

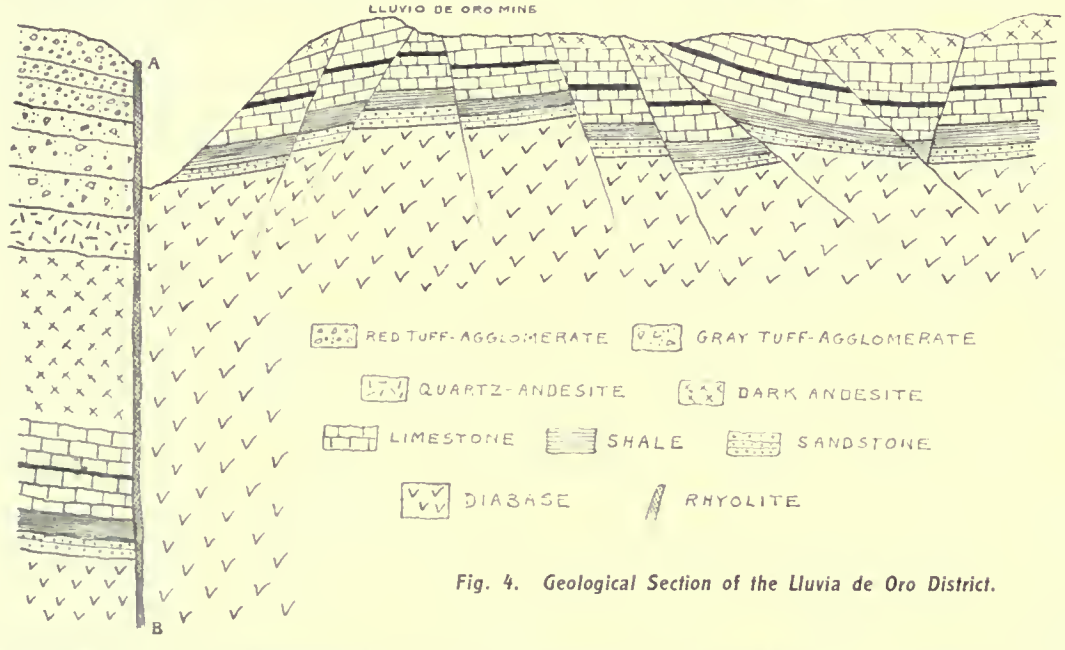

Fig. 4. Geological Section of the Lluvia de Oro District.

The Prospector.

Enquiries sent to this department are answered free of charge, if submitted by subscribers who are not in arrears. The full name and post-office address of the sender must be given, otherwise no answer will be made. Those who are not subscribers must accompany their questions with a fee of $3 for each question. No assays are made.

A piece of Basalt was sent by J. W. S., of Glendale, Oregon.

The specimen sent by C. W. E., of Ashland, Ore., is a Hydrocarbon.

The specimen sent by L. H. N., of Creede, Colo., has not been received.

A Shale carrying much organic matter was sent from Temascaltepec, Mex., by B. McD.

C. E. R., of Paris, Cal., sends a Tuff and vein Quartz stained with Iron. The quartz may carry gold, and should be assayed.

The two specimens sent from Greenwood, Cal., by L. E. L., are Andesite and Quartz, with Chalcopyrite. The latter might carry some gold.

R. W., of Joy, Utah, sends: No. 1, decomposed Andesite; No. 2, Andesite and vein Quartz; No. 3, Quartz; No. 4, weathered Diorite or Andesite; No. 5, Quartzite.

We could detect no platinum in the specimen sent by V. E. M., of Glendale, Ariz., and would hardly expect it to carry any. However, the only safe test is an assay.

The rocks sent by J. W. H., of Tonopah, are: No. 1, Andesite; No. 2, Andesite; No. 3, Andesite; No. 4, Rhyolite; No. 5, Andesite; No. 6, Diorite; No. 7, Andesite.

A piece of Quartz and grossularite Garnet carrying a seam of Galena, Chalcopyrite, and Sphalerite was sent by A. A., of Grizzly Flats, Cal. It should be assayed for gold and silver.

R. I. G., of Vernon, Nev., sends: No. 1, Basalt; No. 2, Basalt; No. 3, Basalt; No. 4, altered Andesite; No. 5, Basalt; No. 6, much weathered Diorite or Andesite; No. 7, altered Andesite, carrying amygdules of Quartz, Calcite, and Zeolites; No. 8, Opal and Chalcedony, stained with Copper and Iron; No. 9, Chert; No. 10, Quartz; No. 11, Dacite; No. 12, glassy Dacite; No. 13, glassy Dacite.

THE salt deposits of Michigan lie partly in strata of Silurian age and partly in those at the base of the Mississippian. The deposits which are worked are in the Saginaw and St. Clair valleys. The beds are of rock salt, but they are exploited by means of wells, the artificial brine from which is used directly in chemical works or is evaporated to dryness in a series of covered vats.

The Settling and Collection of Dust in Flues.

Written for the MINING AND SCIENTIFIC PRESS
By L. S. AUSTIN.

In considering the principles applicable to the settling of dust accompanying the gases escaping from furnaces, we may apply those relating to the settling of sand and slime in water in settling-tanks.

To make a settling-tank as effective as possible, it must be traversed from entrance to exit by an entire current of uniform velocity throughout. To do this the water cannot flow into the tank as a downward-plunging stream, but should be passed down behind a perforated partition as

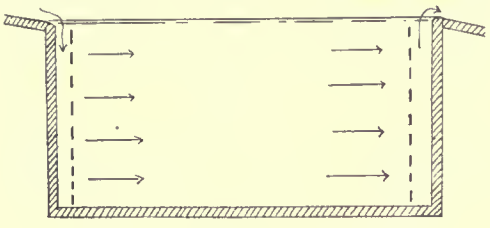

Fig. 1.

shown in Fig. 1, through which it issues in little jets or streams, which, widening, soon coalesce into a whole current, with the same velocity from top to bottom.

In regard to the settling rate of particles of mineral or dust through air, we know that the smaller the particle the slower it will settle, but the larger grains approach the theoretical velocity, $V = \sqrt{2gh}$. Fig. 2 shows the rate at which grains of the sizes specified have been found to fall through still air, the vertical distance traversed being 10 ft. Neglecting the resistance of the air, the grains should fall 10 ft. in 0.78 second, as represented by the asymptote XX. It will be noted that, according to the experiment, the finer grains would speedily fall from top to bottom of a horizontal flue 10 ft. high, and even for the finer dust, the time needed is short. The rate of fall in water is comparatively slow, and hence tanks should be large enough to give time for settlement. On the other hand, with flues or chambers, the fall being rapid, such flues may be shorter, providing the speed of the current has been sufficiently checked. In either case the path of the particle will be a diagonal, the component of the horizontally moving current and the velocity of fall in the fluid. Particles of from 100 to 200-mesh settle in from 2 to 4 seconds, with an average of 3 seconds, while those of less than 200-mesh fall in periods of 4 to 15 seconds, or even 25 seconds. When experimenting upon flue-dust from McDougall roasters the settling rate of the finest grains was 55 seconds. The finer flue-dust, near the stack, from the flue of a silver-lead smelting plant took 100 seconds to settle, and these latter observations were made in air fully illuminated by the sun. Beyond this, particles, even if carefully watched, disappeared from view. The most serious obstacle to the final settling of dust in the horizontally moving current of escaping gases is the inversion currents produced by it;

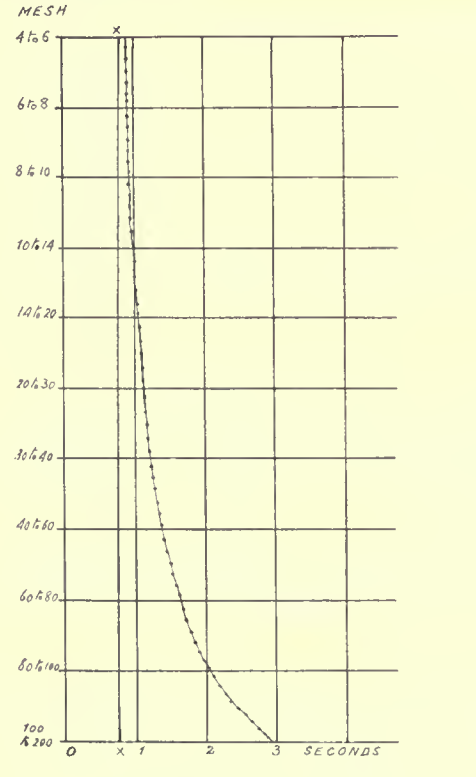

Fig. 2.

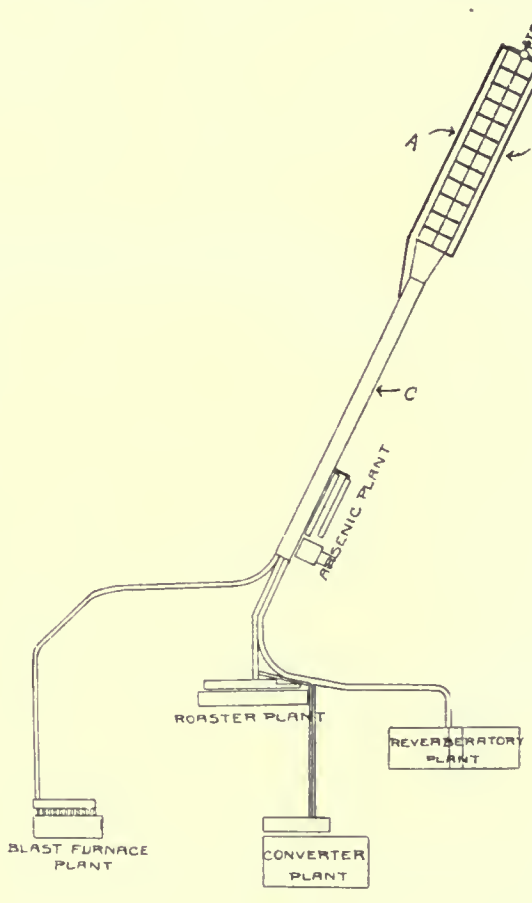

Fig. 3.

it creates eddies, which lift the finer ore particles, and so prevent their final settling.

As to relations of length and width in settling; let it be assumed for the purposes of discussion that we have a flue of a clear depth of 10 ft. with an additional 2½ ft. for the accumulation of dust, or 12½ ft. altogether. Let us then consider, with this depth, the length and width necessary for settling the dust-particles. We shall assume that we have a flue 120 ft. wide by 1,122 ft. long, as at the Washoe plant, Anaconda, also another 120 ft. long by 1,122 ft. wide, or in the latter case that the current is admitted all along the wall of the flue on one side and then, traversing it, escapes by openings in the opposite wall. This supposed flue is divided by cross-walls so that any division of it can be cut out and cleaned without disturbing or interrupting the flow in the rest of the system. Either of these flues has the same area (120 by 1,122 ft.), and if in each a perfect whole current exists, then the first will be the poorer, the second the better for settling the dust, because the faster the current, the more will the settling be disturbed by inversion currents or eddies. The calculated velocity in the flue 120 ft. wide is

3.47 ft. per second, and in the flue 1,122 ft. wide this would be reduced to one-ninth, or 0.38 ft. per second. A whole current at 0.38 ft. per second would settle the finest dust from the McDougall roaster in a distance of 21 ft. and the flue dust from the silver-lead furnace in 38 ft. The inversion currents would be strong in the narrower flue and almost absent in the wide one, the latter being in this respect superior. To get the best result, however, we must have a perfect whole-current feed, and a perfect whole-current discharge. It would probably be done by making numerous perforations through the entering and exit walls, with baffles; and these perforations would have to be adjusted by careful observation with a delicate anemometer. The gases passing into the exit-flue (*B* Fig. 3) would contain but little dust, and would seldom need to be cleaned out. The heavier flue-dust will have been settled out in the lower, 60 ft. of flue *C*, and hence there would be but little caught in the narrower entrance-flue *A*. It is quite possible that the gases in *B* would drop (by condensation) the remaining arsenic that they contain, giving a special product rich in that metal.

The material of which the flue is constructed should be, in copper practice at least, of an acid-resistant nature. In silver-lead practice more sheet-steel can be used, particularly for the hopper-bottoms of the flues. Finally, such a flue should be designed to dispose of storm-water, and it may well be low and covering a large area. The bottom of the flue should be smooth and unobstructed, so that eddies may not be created. We have an analogous phenemenon in placer mining, where, if the bottoms of the sluices are rough, they cause a good deal of 'boiling,' which interferes with the settling of the gold.

EARTHQUAKES.—Dana, in the fourth edition of his Manual of Geology, published in 1895, called attention to the fact that two great systems of courses, or trends, prevail over the world—a northwestern and a northeastern, transverse to one another. He also showed that the islands of the Pacific ocean were adapted to the northwest trends. I can now, in the light of my later studies of the Mexican plateau and the West Indian islands, suggest a continuation of these curving northwesterly trends throughout the coast ranges of California and the Mexican plateau, Central America, and the Great Antilles, crossing the older northeastern trends of the Appalachian and the northern trends of the Laramide, or Rocky Mountain system.

It is also possible now to speculate upon the proposition that the axial trend of the mountain-making movements of the continent, which dominate all of our great physical features, has progressively swerved from northeastward, through north, to a northwestward direction, in which latter direction lies the present zone of stresses and corrugations, following a course around the globe more concentric with the pole than radial from it. The great stresses of the San Francisco and Jamaica earthquakes, apparently, are manifestations of a recent series of stresses along this later northwest zone.—Robert T. Hill.

THE principal fluorspar-producing deposits of the country are in Caldwell, Livingston, and Crittenden counties, Kentucky, and Hardin and Pope counties, Illinois, though there have been reports of valuable prospects in neighboring counties. Colorado has begun to be an important producer, and a small, but increasing production is reported from western Tennessee. Arizona, which has reported the production of varying quantities of fluorspar in recent years, has dropped out of the producing list, assessment work being all that was done upon the prospects there.

Letters of a Self-Made Miner to His New Foreman.—III.

Written for the MINING AND SCIENTIFIC PRESS
By MATT. W. ALDERSON.

My dear Tom:

You have obtained good men. You have placed them intelligently. The next important thing to do is to keep them. And to keep good men you must treat them right. Some persons, if told this, would think that to treat the men right you must let them do just as they please. But to raise children without any restrictions is the sure way to spoil them, and "men are but children of a larger growth."

I am a strong believer in discipline. I shall have suggestions to make to you from time to time, and I shall expect you to see them carried out without my having to make the same suggestion twice. I wish you to train the men under you to see your wishes carried out in the same way.

A good teamster doesn't push on the lines, nor does he give them a hard pull. He holds them just so each horse is exactly where he ought to be. He seldom uses the whip. One word and every horse steps forward into the collar. To make a good foreman, you must have the whip in your hand, but your men must feel that you will never use it except for cause. Some foremen think that they must fire a man occasionally to keep the men in condition of apprehension as to what may happen to them. If one of your men is obstreperous, have the tact to take him aside and impress him with the necessity of his pulling in line as you wish. If he doesn't comply, give him his time.

Your men must be well fed. There have been times in my life when I was short on provisions, but seldom a time when I was short on appetite. I know that when a man works as he ought to work in a mine, he wants something good to eat, and plenty of it. We have a boarding-house under contract to furnish us the best of meals. This will not be under your supervision; but, if there is any complaint, or you can make any suggestions for betterment of the service, you will please let me know.

Next in importance to good food is good air. No man can do justice to himself in foul air. You will take particular pains to see that all places are well ventilated. And you will protect your men from the other extreme, so no one will have to work in an unnecessarily strong draft.

I wish you to counsel with your men. You may not need to learn from them, though you will never have a man on the force from whom you may not learn something; but you pay a man a delicate, high compliment when you ask his advice, and you preclude the possibility of his getting the idea that you think you know it all. When a foreman creates the impression among his men that he thinks the sum of all knowledge is concentrated in the territory beneath his hat band, his days of usefulness are at an end. Again, and above all else, in counseling with those under you, you are helping them—you are training them to think for themselves; and the valuable employee is the one who puts thought behind his muscle.

With your practical knowledge of mining, you will find many an occasion to make valuable suggestions to those under you, and these made in the right spirit always have a good influence. Thus, in making your rounds, you may find a man making a drive in hard ground. He has gouged in 18 inches or more, and is ready to break to the gouge. Encourage him to carry

the gouge in farther, if he puts in a day at it. He might hesitate to do it without your encouragement, through fear that you might think he was not accomplishing anything. But explain to him that he will gain by it; that if ground is tight the breaking holes will have a better chance; that oftentimes ground will slab off beyond the end of the holes. When the man follows your advice and sees good results, he will feel grateful that he is working under a boss who knows something.

I wish you to be a source of encouragement and inspiration to your men. You will go into an end some day and find a man in hard ground. If you are as bright as I think you are, you will not wait to have your attention called to it. You will speak of it first. You may make some such remark as: "That's tight ground, but there's one satisfaction, I have a man up against it who's good for it." Or, perhaps, you may say: "Several of the men are in hard ground this week." After you have passed on, the man will pound the drill with more vigor as he says to himself: "The boss is all right. He knows how it is. He's been there himself."

Occasionally a man will be put at work where for the first few days he will make a very poor showing. I was a visitor at a mine one time, and among the men put on one afternoon was one who worked hard, and at night had only succeeded in getting in one short upper. Things had gone hard with him from start to finish. His muscles were not hardened, the hammer didn't swing just right, some of the drills didn't follow, he noticed the boss was keeping close tab on him, and that flustrated him. At night he was sore and discouraged, and knowing he had not done justice to himself he expected to be fired; so he called for his time. Had such a man been working for me I would have tided him over the period of discouragement. I would have pointed out the things that had operated to make him feel blue, had told him that I had watched him critically, had noticed that he had an easy steady movement in his work, and was satisfied that he would make a good workman for me. If a man works by jerks let him go, but if he is a plodder, if he takes his hammer and pounds away with regularity and persistence, no matter how slow he may appear to be, no matter how hard it may seem to get an idea into his head and to get him to do some things as you are accustomed to having them done, be patient. Once you get such a man trained he goes ahead with the regularity of a clock.

A word of appreciation at the right time is worth a great deal. If a man has done fine work for you let him know that you know it. On the contrary, if a man isn't doing as well as you think he should, don't scold or find fault. A good plan is to say to such an one: "You are doing very fairly, but I think you can do better," and then point out to him how he can improve his way of doing things.

You will have some men who will deliver a round of oaths when anything goes wrong. I have watched the effect, and it always seemed to me that the swearing didn't remedy the matter, that something else had to be done, and that the energy expended in unloading the oaths might be put to a better purpose. Swearing is not a good accomplishment for a foreman. He should have perfect control of himself in every situation.

I would say avoid making a chum of any man under you. Some of the men would be certain to think he was a favorite, and would get all the soft snaps. You should aim to treat all your men alike, and avoid even the appearance of favoritism.

You will think I am very strict, that I am requiring a great deal, that a man can't be expected to remember all these things. All you have to do is to take for yourself a motto ascribed to George Washington: "Never forget that you are a gentleman." All I have said is embodied in that. Have consideration for your men and they will appreciate it. Only occasionally will you find a man who has been raised to expect a certain amount of domineering in a boss, and who thinks kind treatment a sign of weakness. Let him go. The good words that others will speak for you will bring dozens who will want to take his place.

Sincerely yours,

TIMOTHY STRONG.

Decisions Relating to Mining.

Specially Reported for the MINING AND SCIENTIFIC PRESS.

Possession for the statutory period does not relieve the possessor from doing the annual assessment work required by the United States statutes, and upon failure to do such work in any one year, the land becomes subject to re-location, notwithstanding he may have occupied it for more than the statutory period preceding any re-location. And such possession and working for the statutory period, when proved in the Land Office, or before the courts, gives the possessor the status of a valid locator. But it is said that testimony to prove such possession is immaterial, where the party offering it claimed under a location duly made pursuant to law, and there was no issue as to the original validity of such location, but the question being simply as to whether he had forfeited it by failure to do the annual assessment for a given year.

Upton *v.* Santa Rita Min. Co., (N. Mex.) 89 Pac. 275. (Feb. '07).

A failure to comply substantially with the statute requiring the locator of a mining claim to post a location notice in some conspicuous place on the location, renders the location void. But the mere fact that the portion of the claim upon which such notice was posted by mistake overlapped or conflicted with the previous existing claim, was held not sufficient to invalidate the location. The location was held to be good as to so much of the claim not in conflict.

Upton *v.* Santa Rita Min. Co., (N. Mex.) 89 Pac. 275. (Feb. '07).

The statute permitting the filing of an additional or amended declaratory statement of the location of a mining claim where the locator has reason to believe that his original certificate is defective, or that the legal requirements have not been complied with, relates back to the date of the original location, in the absence of any intervening rights. And where the name given for a mining claim in the original declaratory statement was Annex, and in the amended declaratory statement the name given was Annex-Plumber, and the amended statement referred to the Annex location and declared that it was intended as an amended statement of the Annex claim, the amended statement was held not defective by reason of the word Plumber.

Butte Consol. Min. Co. *v.* Barker (Mont.), 89, Pac. 302 (March, '07).

In an action to recover the amount paid for mining claims on the ground that they were never legally located, the question whether there had been a discovery of a vein or lode within the limits of the claim as required by the act of Congress before its location, was held to be one of fact for the jury.

Whitney *v.* Haskell (Pa.) 66 Atl. 101 (Jan., '07).

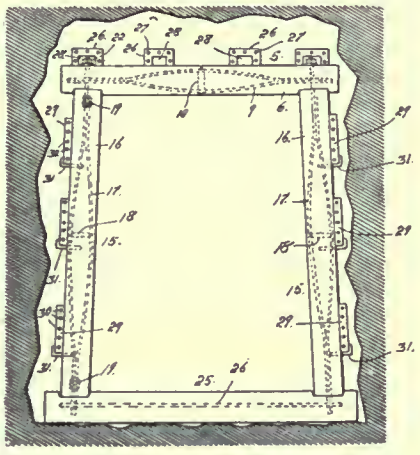
There is held to be an implied covenant for good title and peaceable and quiet possession in a lease for years for oil and gas, and such implied covenant of warranty is not limited to the right of expiration for oil and gas, but when produced the right to the amount stipulated for in the lease is likewise thereby protected.

Kilcoyne *v.* Southern Oil Co. (W. Va.), 56 S. E. 88 (March, '07).

MINING AND METALLURGICAL PATENTS.

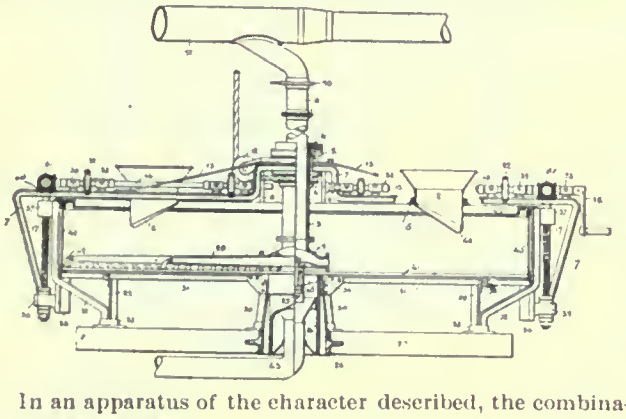
Specially Reported for the MINING AND SCIENTIFIC PRESS.

ARTIFICIAL TIMBERING FOR MINE-TUNNELS.—No. 851,629; Darwin W. Shepard, Denver, Colorado.



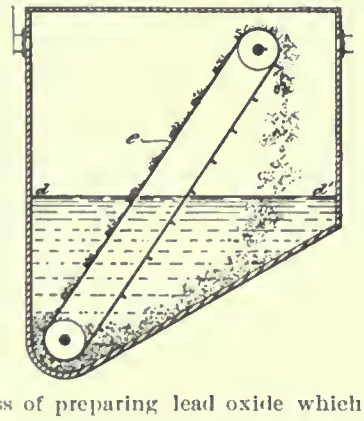
A timbering structure for mines including a frame work composed of top beams and uprights at the extremities of the top beams, the body portion of each beam of the structure being composed of artificial stone in which are embedded metal members bowed outwardly between their extremities in the direction of the strain to which they are to be subjected.

CONCENTRATOR.—No. 851,426; Henry L. Lightner, San Francisco, Cal., assignor of one-third to William Priest and one-third to Henry Felge, San Francisco, California.



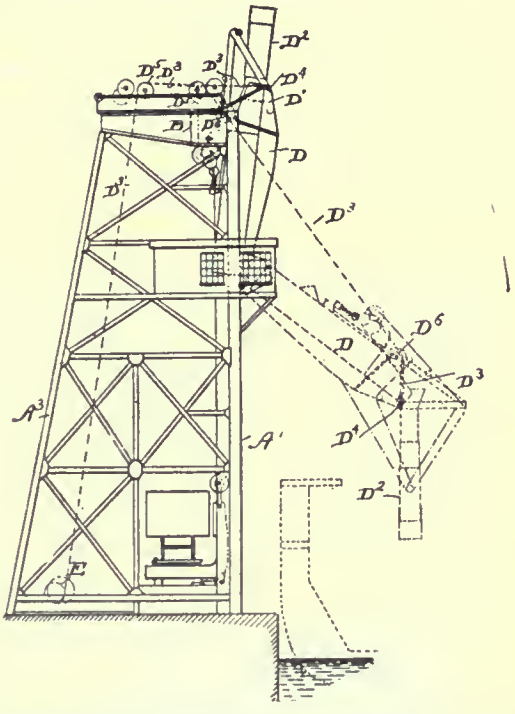
In an apparatus of the character described, the combination of a vat having a central hole in the bottom thereof, means for feeding at the periphery of the vat the material to be treated, revoluble hollow arms, and nozzles connected therewith, discharging over the surface of the material in the vat inwardly or away from said periphery, means for supplying compressed air to said arms, means for revolving said arms, and means for raising said arms relatively to the vat.

PROCESS OF MAKING LEAD OXIDE.—No. 852,325; Clarence A. Hall, Philadelphia, Pennsylvania.



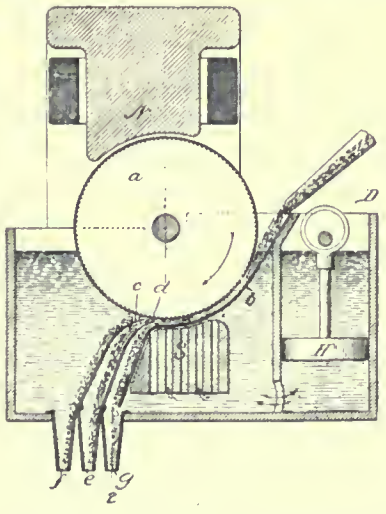
The process of preparing lead oxide which consists in causing a body of comminuted water wet lead to repeatedly pass as a shower through a changing body of air under pressure to induce oxidation, repeatedly plunging the showers of lead particles into a body of water, thereby detaching the oxide and exposing fresh surfaces of the lead particles for further oxidation, and repeating the foregoing steps until substantially all the lead is oxidized.

CAR-DUMPING APPARATUS.—No. 851,014; Frederick W. Lovell, Cleveland, Ohio, assignor to the McMyler Manufacturing Company, Cleveland, Ohio, a Corporation of Ohio.



In combination a tower and a dumping-apron pivotally supported at one side of the tower and having hoisting-ropes, a forward transverse girder carrying supports for sheaves for the hoisting-ropes of the apron, said girder being set back of the vertical plane of the points of pivotal support of the apron so as to afford a clear space above said points of support into which clear space a portion of the apron may be drawn.

MAGNETIC ORE-SEPARATOR.—No. 851,046; Henry H. Wait, Chicago, Ill., assignor to International Separator Company, Chicago, Ill., a Corporation of New Jersey.



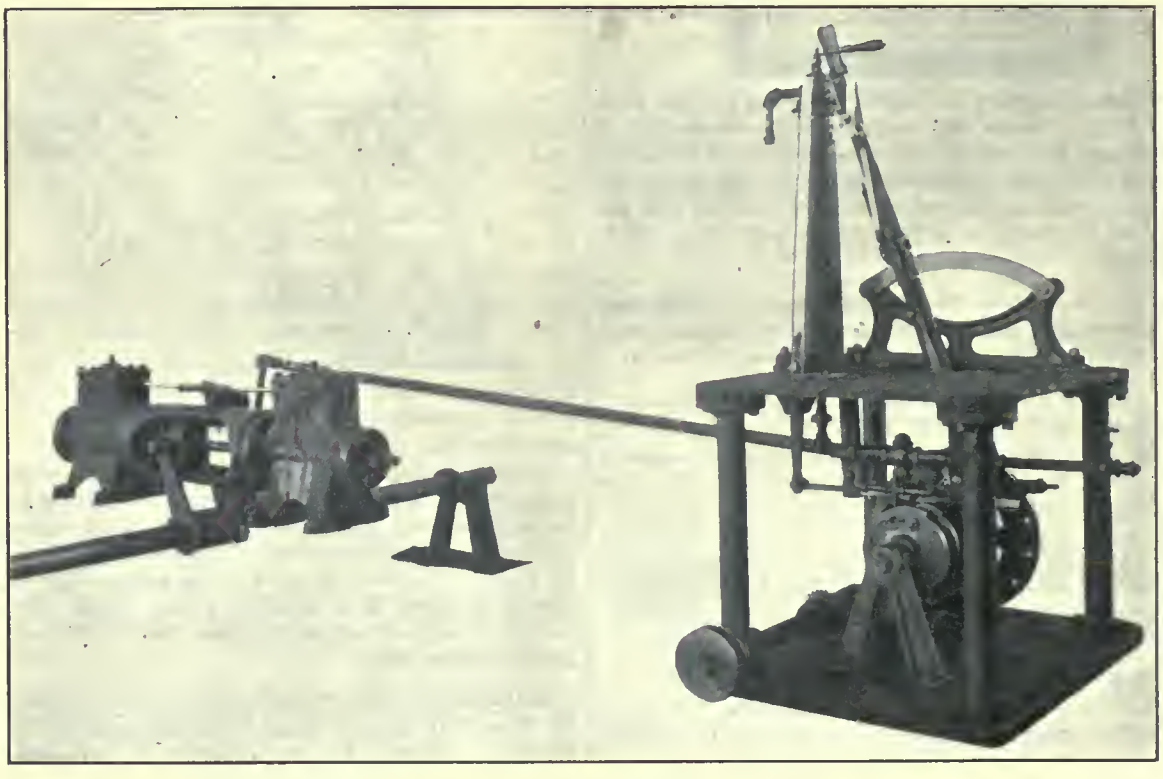
In an ore-concentrator, the combination with a revolving magnetic cylinder having means for causing flux dispersions at its periphery, of a magnet-pole below said cylinder, a support forming a passage-way between said cylinder and magnet-pole for the materials to be separated, a divider for separating the attracted from the non-attracted materials, a vessel adapted to contain a fluid medium surrounding the operation portion of the cylinder, and means for imparting a vibratory motion to said fluid medium.

The Nicholson Engine-Stop.

This is a device for use on link-reversing winding engines. The illustration shows the lever forward and valves full open, and the tappet-roller is ready to push lever to middle position for final cut-off on the engine-valves. This also operates on the steam-valve for applying the brake. The reverse lever can be set for backward motion, and by reversing the engines, this also reverses the motion of the machine. When the reverse lever is brought to the centre of the reverse-quadrant and the engine-valves are centred, the lever can only be operated in the opposite direction; but if it is desired to go a little farther up, this can be done by giving the reverse-lever a little extra pull or push, thus compressing the spring. This will allow a slight opening of the valves and the expansion of the spring, with the disc revolving in the same direction, will act quickly on the lever again and bring the main valves central over the steam-ports. When the stop begins to act, the lever begins to move forward or backward. The engineer usually has his hand on the lever in regular hoisting; when the lever begins to move, he has positive warning that the cage is approaching the end of hoist or prearranged distance. If he fails for any reason, the machine will centre the valves and apply the brake. If hoisting is done from more than one level, one drum is usually made loose and driven by a clutch, and the other keyed fast. For this work a double machine is used. One side is driven from the tight drum, the other from the loose drum. Any change for different levels makes a like change in the machine automatically, thus eliminating any chance of failure on the part of the engineer for adjusting the stop for the required hoist. Tests were made with the Nicholson engine-stop installed on two pairs of 24 + 48 in. first-motion engines, each with conical drums 8 to 10 ft. diam. with a hoisting speed of 1,680 ft. per min. with a dead load of 5,000 lb. coal, cages, and car in balance. On one of these pairs of engines hoisting into curved guides where self-dumping cages are used, the engine-stop was set to hold the cage at the entrance to the curved guides where it is set to stop each hoist. The engineer manipulates a special valve to the dumping point of the curved guides until the car has tilted at an angle of 37½°, dumping into a chute conveying the coal into the bins. In this case, where self-dumpers are used, the car is not taken from the cage, only at the bottom of the shaft. Ordinarily great care must be taken by the engineer when pulling into the guides.

The other pair of engines, of the same size and with the same load, was worked under a different condition. The cages were hoisted above the landing, the car being pushed off for dumping. The lift in this case was 367 ft.; the hoist was made in 13 seconds; rope speed 1,680 ft.; load, 5,000 lb. Trials were made in the shaft; the engine-stop operating on the main valve alone, showing a distance of 62 ft. traveled after the beginning of cut-off. Trials were made with both brake and cut-off applied, showing a variation of 16 in., both proving entirely satisfactory. The tests were emergency trials, and to prove that the stop would take care of a runaway cage. The trials also proved the stop would not interfere with the output of the mine; the time allowed for hoisting was 15 sec., time of test hoisting 13 seconds.

There are numerous devices for stopping hoisting engines all at fixed distances above the top landing, consequently when the ascending cage passes the landing at the surface, the descending cage strikes the bottom with full velocity, and causes more damage at the bottom than at the top. This was the case at the Auchincloss colliery of the D. L. & W. railroad, which happened over a year ago, when ten men were killed on account of the descending cage crashing through the landing fans set to receive the cage and the ascending cage pulled over the sheaves. This Nicholson engine-stop has been applied to engines built by the Vulcan Iron Works of Wilkes-Barre, Pa., ranging in size 42 + 30 in. diam., 60 in. stroke with drums 12 ft. diam. for hoisting water and coal, also on 24 + 48 in. engines with double-cone drums 8 to 10 ft. diam. It is obvious in these days of high rope-speed and increased steam-pressure, that some protection must be given the operators and engineer for the prevention of the many fatal and expensive accidents happening from overwinding through some slight error on the part of the engineer or a faulty throttle. There are cases where a speed limit is required in hoisting, and provision has been made whereby the speed is checked automatically when the increased speed limit is reached, allowing the engines automatically to resume their normal speed. This device is particularly desirable where hoisting water. The machine is simple and effective, and does daily just what is claimed for it under the various conditions of hoisting.



The Nicholson Engine-Stop.

Editorial.

IN OUR ISSUE of February 16, comment was made in response to a subscriber's inquiry as to the right of a junior locator whose claim overlapped a senior claim to acquire by mere gravity the area in conflict upon the failure of the senior to perform the annual assessment work. It was there observed that prior to the decision of the United States Supreme Court in the Lavagnino-Uhlig case, the rule had obtained that the junior locator could not secure title to the area conflicting with the senior without re-locating after the lapse of the year upon the failure of the senior to perform the necessary work, and that in its decision in the Lavagnino-Uhlig case the Court had, without in any way referring to or commenting on its former rulings, practically reversed itself. This last expression of that august tribunal has disturbed the equilibrium of both bench and bar in the mining regions. As a further contribution to the literature on the subject there appears in another column of this issue a communication from Mr. Henry M. Hoyt, 2nd, a well-known lawyer of the Nome bar. We feel confident that Mr. Hoyt's logical presentation of this perplexing situation will be of interest, not only to mining lawyers and engineers, but to many of our subscribers who keep in close touch with the evolutionary development of our somewhat complex mining laws.

OUR LONDON CORRESPONDENT refers to the world-wide interest of Americans in mining and defends himself from the charge of giving too much space to Siberian operations. Having regard to the fact that such representative American mining engineers as T. H. Leggett, C. M. Rolker, and H. A. Titcomb have been called upon lately to examine mines in Siberia, two of them being there now or else on their way, it does seem incorrect to look upon the interest in Siberian mining as merely local. Moreover, W. A. Heywood, formerly in Tennessee, and H. E. West, lately in Mexico, have gone to Siberia recently and a large number of English engineers (such as Pellew Harvey & Fell, and Arthur L. Pearse) are engaged in the development of enterprises in that country. Some of the readers of this paper must necessarily be interested in the subject. But the humor of the particular protest made by our friend Mr. C. W. Purington is that he himself has been since engaged to undertake professional work in Siberia, a region with which he made a geological acquaintance several years ago.

GUANAJUATO AND PACHUCA are seeing rapid advance in cyanidation, and the passing of the *patio* process. At Pachuca excellent results have been obtained by Mr. A. Grothe in his new plant, consisting

of five conical-bottom vats 40 feet high and 15 feet diameter, in which sand and slime are agitated by air. Six horse-power suffices to agitate 100 tons of ore. The extraction is rapid. The cyanide-plant of the Hacienda San Francisco has been in operation six weeks and so successfully that plans are being drawn for changing several pan-mills to cyanide-plants. The owners of the San Rafael mine are about to add 20 stamps to the 40 already at work, using three tube-mills for re-grinding. The pulp will be crushed in solution and will then be agitated by compressed air in both of the vats. Butters filters are to be employed for treating the residue. At Guanajuato there is similar activity. A 1,000-ton plant is assured for the La Luz mines, many of whose stockholders are mining engineers of repute. The plans call for 320 stamps, concentrators, re-grinding machinery, and a cyanide annex. Machinery for a 60-stamp mill and cyanide-plant is reported to have been ordered for the Tajo de Dolores mine. We are glad to give this news. The encroachment of modern practice upon the historic precincts of Mexican mining is one of the most interesting in the advance of technical science.

Industrial Efficiency.

ON the page opposite we quote a suggestive explanation of England's lack of success in the industrial competition of the present day, as compared to Germany and America. The point is made that England is a nation at play, looking upon work as a necessary evil and games as the real purpose of life. It is amusement mad, not dissipated. In contrast, the systematic effort of Germany and the individual energy of the American in business are emphasized. And it is largely true, as true as such broad statements can be. Nor need we dwell upon the conditions that have made the American industrially more efficient than his contemporaries; there are good reasons why he should be so; he represents, by descent or as an immigrant, the more enterprising and restless spirit of Europe; he has had, and he has still, the great stimulus that comes to those that are engaged in developing a continent; he has freedom of opportunity and equality before the law; some of the last may be a fiction in these days of organized monopoly, but even the idea of equality of opportunity has fired the imagination of many a good man. However these things be, we have the undoubted result, as Dr. Arthur Shadwell says, that the American is industrially most efficient and successful. But we shall not dwell on that; the question we ask is whether the price paid has not been too high. Take our own profession, that of mining and metallurgical engineers. Are the Americans ahead? Yes. Why? Because they apply to their work the same concentration of purpose and sustained effort that they do to football. They make a business of their profession, as of their games. For that reason the games are destroyed as sport and for the same reason they are apt to gain success in their profession at the expense of everthing else. The Englishman stops work at five o'clock and plays golf or tennis; the German drinks beer and listens to music; the American is still working. He works at night, he talks shop at his meals, he ruminates on machinery and mines in his sleep. His intensity is splendid. Now the Englishman's tennis and golf, and the German's beer and music, are well enough in their way, but to think tennis and golf, or dream beer and music, during hours not properly assignable to them is a handicap, as against the man who puts them aside and devotes himself unreservedly to the work of his life. Of course, we exaggerate; that is necessary to illustrate the point, the inference from which is this: That while England is a nation at play, shirking business for the sake of amusement, the American people give to business what was meant for happiness; they sacrifice too much to industrial success. A life of grasping and grinding is not worth while, the forces of acquisition and brute trading do not tend to moral or intellectual progress, the aim of science should be higher than to make cheap iron, the main purpose of education should not be the gaining of a big salary. The fact is the American imagination is obsessed by the spectacle of Rockefeller, Pierpont Morgan, Harriman, and a dozen other enormously rich men, who represent the fine flower or the poisonous growth, as you will, of money-making. The Englishman takes more interest in the winning cricket eleven or the champion oarsmen, putting them on a pinnacle of fame higher than the millionaires of the moment. Is there not room for something between the two, for attention to work associated with a certain amount of healthy exercise, civic duty, domestic happiness, and personal culture? Commercial industrialism is over-rated, the whole happiness of man is not in it, and if it be the one god of our idolatry, then this great country, the greatest in the history of mankind, will be but a gigantic futility.

FROM BUTTE comes the story that the richest ore ever found in that district has been discovered in the Receiver mine and that the ore contains 94.2 per cent copper. Then, as if to silence the criticism of the timid mineralogist, we are informed that "the Receiver ore, of which there was, of course, only a small quantity found assaying 94.2 per cent, is the kind of thing that makes scientists, experts, and accepted authorities change their rules and revise their works." But why the "of course"? If there be "a small quantity" of stuff such as no scientific man ever saw or dreamed of, why should there not be a mountain of it? When you go to work to confuse scientists and experts, why not do it thoroughly? Next to native copper, the richest copper mineral is cuprite, containing 88.8 per cent; then comes chalcocite, with 79.8 per cent. At least that was the general supposition until the scribes of Butte discovered this new mineral, in order to prove the ignorance of the authorities in mineralogy. We hope that the Butte mines, and especially those of the Continental district, will produce lots of it, whatever it may be, even if we find that it assays more nearly 64 per cent than 94. It will indicate some respect for the feelings of scientists and experts if the percentage could be "revised" rather than Dana, Rutley, or Miers.

By the Way.

In a recently published book by Dr. Arthur Shadwell, we find the following instructive passage on industrial efficiency:

The American method of work in the industrial sphere is distinguished by the following features: Enterprise, audacity, push, restlessness, eagerness for novelty, inventiveness, emulation, and cupidity. Employers and employed have exhibited the same in their degree. The manufacturer aims at extending his business, he takes up novelties, encourages invention, studies the market, tries devices to increase output and diminish cost. Hence, for instance, the standardization of products, the organization of the workshops, the demand for highly educated officers, and the alert control exercised by large combinations, which enable a central authority to check the management of each component by the results of the rest, and to screw up any that are growing slack. The employed are eager to earn as much as possible and to better themselves. Both are absorbed in their occupation, and bend all their energies to it. I do not mean to say that all these qualities are invariably present; I have shown that in some trades and centres they have been conspicuously absent. But they are the distinctive qualities and methods that have won success; and broadly speaking, they have been exercised without either help, save the tariff, or hindrance from outside. The industrial expansion of Germany presents another picture. It has been achieved by equally hard work, but the adventurous audacity and restless search for novelty of America have been replaced by steady and watchful effort. The circumstances of the country, not less than the national character, have imposed this difference. But there is another, not less striking, to which every subject handled in this book bears witness. The industrial population has not been left to carve out its own destiny, but has been guided and helped at every step. All sections of the community, from the throne to the workhouse, have contributed something. *Laissez faire*, or *Manchesterthum*, as they say in Germany, is dead; ordered regulation is accepted and applied with infinite pains by the legislature, Government departments, municipalities, and private citizens. It is seen not only in the scientific tariff but in the careful and judicious factory code, the State system of insurance, the organization of traffic and transport by railway and canal, the fostering of the mercantile marine, the educational provision, municipal action and poor-law administration. So the edifice has been built up four-square and buttressed about on either side. It is a wonderful achievement, in which every unit has played a part, and the spirit which has brought it about is the spirit of duty and work. * * * England is like a composite photograph, in which two likenesses are blurred into one. It shows traces of American enterprise and of German order; but the enterprise is faded and the order muddled. They combine a curious travesty in which activity and perseverence assume the expression of ease and indolence. The once enterprising manufacturer has grown slack; he has let the business take care of itself, while he is shooting grouse or yachting in the Mediterranean. That is *his* business. The once unequalled workman has adopted the motto, 'Get as much and do as little as possible;' *his* business is football or betting. Each blames the other. * * * Then the manufacturer complains of being handicapped in various ways; and he is justified. He is handicapped by laws and by-laws and obsolete regulations, which have the effect of hindering him in some respects without any set-off in the way of help. And what do all these mean but carelessness and neglect on some one's part? Legislators who pass laws without taking the trouble to ascertain the facts, or understand what they are doing, or who fail to alter obsolete and detrimental ones, such as the patent laws and the tax on industrial alcohol; Government departments too indolent to watch events and adapt regulations to changing conditions; local authorities applying by-laws without discretion, piling up rates without thought and administering the poor-law without care; everybody bent on pleasure and amusement. That is the universal business. No one is in a position to abuse the rest; they are all in the picture, and wear the same expression from top to bottom of the social scale. Not every individual, of course, but every class. We are a nation at play. Work is a nuisance, an evil necessity to be shirked and hurried over as quickly and easily as possible in order that we may get away to the real business of life—the golf course, the bridge table, the cricket and football field, or some other of the thousand amusements which occupy our minds, and for which no trouble is too great.

THE American possesses in great degree the ability to make a living. But he possesses in a slight degree only the ability of using his leisure hours with pleasure. In short, we have not developed the art of living but have developed the business of making a living. To make a young man an artisan is all right. But public opinion should do better. It should show him how to relax and to play. There has been a vast improvement in this. The diversification of industry and the development of machinery has reduced the minimum working day to eight hours. But the other hours are often foolishly spent. If each working family possessed a home with a small acreage devoted to extensive farming and with a poultry yard and a few live stock, the increase in the productivity of the United States would be enormous. This is one way to increase the efficiency of happiness throughout our land. A person's happiness is like the amperes of Ohm's law, his means of satisfying his desires divided by his wants. The current flow of pleasure should be increased by increasing in a rational manner the natural means rather than by decreasing the wants. With all our national wealth and greatness there is some foolishness about the lives of rich and poor save in isolated rare individuals. How to cultivate repose and to relax and divert the streams of energy in other lines—the proper balance between one's powers and his task, the proper distribution between one's physical, intellectual, and spiritual faculties, is the greatest question of anthropology.—*Electrochemical and Metallurgical Industry.*

THE practical worker should interest himself in fundamental principles with the object of inducing himself to improve and develop the processes upon which he is working, and should therefore look into discussions which at first appear to have too theoretical a character. Everyone who tries to improve, acts on a theory of some sort, though not always conscious of it, and upon the soundness of this theory success largely depends. A knowledge of theoretical principles is therefore beneficial, if only in conducing to prevent fallacious reasoning. The technical man in charge of reduction works is constantly called on to decide on the adoption, or otherwise, of a so-called improvement, and in order to be able to discriminate successfully between the real and the apparent, it is necessary to use sound reasoning based upon theoretical principles and upon practical experience. For, to make an alteration without investigating the reason which leads up to it, is but little short of gambling; or to adopt a so-called improvement, only because it has been successfully used elsewhere, points to incompetency.

Personal.

CLAUDE VAUTIN is at Santiago, Chile.

JAMES W. MALCOLMSON is at Mexico City.

FRANK J. BOOTH is at Paso Robles, California.

R. S. BOTSFORD is at Cruz del Eje in the Argentine.

HERBERT J. DALY has arrived in London from Melbourne.

H. R. PLATE has left Denver on his return to Ely, Nevada.

W. C. PATERSON has returned to Mogollon, New Mexico, from Denver.

JAMES W. NEILL has been examining mines near Prescott, Arizona.

R. GILMAN BROWN is expected in San Francisco some time in June.

M. B. HOLT has returned to Silverton, Colo., after a short visit to Denver.

W. S. KEITH, lately of San Francisco, is in charge of the smelter at Sumpter, Oregon.

LEON M. HALL returned this week to San Francisco from Virginia City, Nevada.

JOHN H. MARKS has returned to Denver from Goldfield and other camps in Nevada.

IRA C. BOSS has returned to San Francisco from New York. He will remain here.

NORMAN DANVERS POWER arrived on the *Mongolia*, on his way from Australia to England.

C. D. WHYTE, recently from Scotland, is at the Bonanza King mine, in Trinity county, California.

H. VINCENT WALLACE is in Otero county, New Mexico, making an examination of a copper mine.

ALGERNON DEL MAR is manager for the United Colorado Mines Co., in Gunnison county, Colorado.

GEORGE J. BANCROFT has completed an examination of the Stratton's Independence mine at Cripple Creek.

E. H. MESSITER has left New York on a business trip that will cover Utah, Colorado, Arizona, and Texas.

C. W. PURINGTON is on his way from London to Vladivostock, to examine dredging ground in Eastern Siberia.

MARTIN SCHWERIN has returned to New York from the examination of mines in the San Carlos district, Arizona.

W. A. CARLYLE has resigned as general manager of the Rio Tinto mines, to undertake consulting work at London.

ROBERT B. LAMB, of Hedley, B. C., is consulting engineer to the Barnes-King Mining Co., at Kendall, Montana.

EDWARD S. WIARD is mill superintendent for the Tecolotes Mining Co., in the Santa Barbara district, Chihuahua, Mexico.

H. BINNIE, a mine-owner from Sydney, N. S. W., is visiting San Francisco on his way to see the mines of the Cœur d'Alene.

EDWARD W. RALPH has been appointed general superintendent for the Boston-Ely Development Co., at Kimberly, Nevada.

VICTOR G. HILLS of Hills & Willis, Cripple Creek and Denver, is making mine examinations in the San Juan region, near Silverton, Colorado.

GEORGE A. PACKARD has returned to Wakefield, Mass., having finished his temporary work as head of the metallurgical department in the School of Mines, at Rolla, Missouri.

CORRIDON H. PUTNAM has returned to Prescott, Ariz., from New York and Denver, where he has been getting estimates on a plant of machinery for his property near Jerome.

CLIFFORD G. DENNIS, manager of the Marfa and Mariposa mines at Terlingua, Texas, has resigned to accept a like position with the Colonial Mining Co., at Ehrenberg, in Arizona.

General Mining News.

ALASKA.

The Treadwell mines have been short-handed since the settlement of the strike. The mines will be operated as before, as an open shop, although union men will have no trouble in securing employment as long as they do not allow their union affairs to interfere with their work. The miners can board where they please; at the company's boarding-house the rate is $30 per month, and that sum will be allowed to those who board elsewhere. There is a shortage of water-power, as well as men, so the plants are not running to their full capacity. Machine-men are especially scarce, but more are arriving on every steamer. ——News from Nome states that more rich strikes are being made on the third beach.——Some rich copper ore has been found on Quartz creek, in the Agiapuk district, about 15 miles from the head of Bud creek. A shipment of four tons netted $475.—— At Ketchikan, the Mt. Andrew mine is adding to its force of men. A compressor has arrived for the Crackerjack mine at Hollis. A third shipment of high-grade ore will be made from the Alaska Commercial Co.'s Jumbo mine.——Work on the Ketchikan Con. Mining Co.'s property will be started as soon as the new 35-h.p. hoist arrives.

Engineers are making a survey for the road from the mouth of the Kotsina river to the mines on Elliott creek. About 1,500 men are employed in building the railroad from Cordova, and six locomotives, five steam-shovels, and 50 cars are at Seattle awaiting shipment, and the new 100-ton steamer of the Hubbard-Elliott Copper M. D. Co. for the Copper river has been landed at the mouth of the Tasnuna river.——At Knight's island the wharf of this company has been completed, and the tramway is being built, with a terminal ore-bin of 500 tons' capacity.

ARIZONA.

COCHISE COUNTY.

At Johnson, a strike of oxidized copper ore was made in the bottom of the 100-ft. shaft of the Imperial company. A cross-cut 30 ft. long at this point, is still in good-looking ground. Hiram Merrill is the superintendent.——The Bonanza Bell company employs 50 men, and is shipping regularly.

GILA COUNTY.

About 200 tons per day are shipped from the Arizona Commercial property at Globe. A new Shay locomotive and other equipment has been ordered for the railroad. Development is progressing well on the Blackhawk and Copper Hill mines of the company.——There have been no developments of importance recently in the Globe Consolidated property. The shaft on the Gem claim is now 680 ft. deep, and some water is coming in. The north cross-cut on the 500 level is still in porphyry and the south cross-cut is still in diorite.——The production of the Old Dominion smelter for May should exceed 3,000,000 lb., and fully 85% of the ore smelted comes from the company's mines. One-half of the concentrator was idle for a week, due to an accident to the Chilian mills. After the first of June, the company expects to produce metal at the rate of 15,000,000 lb. of copper per annum. The average of the ore is about 1¾%. For the year ending July 31, the officials predict a net earning of approximately $300,000.——The Castle Dome mine in the Lower Pinto country has been closed. Engineers sent to examine the property for parties in Calumet, Michigan, reported unfavorably.——The Superior & Boston is looking well, and the drift on the Black Oxide claim is in 90 ft. At the Limestone shaft, a cross-cut started north at a depth of 118 ft., is in 15 feet. At the Great Eastern, cross-cutting to the north is still in progress in mineralized ground.——Over 100 miners are now at work in the Octave mine.——Good ore is being taken out of the New York mine, upon which work was recently started by the United Mines company, under the direction of D. J. Sullivan.—— The Alaska mine is being unwatered at the rate of 30 ft. vertically per day.——A small force of men is working at the Leviathan.——About 10 men are working in the Seventy-six mine, at the foot of Rich hill.——Good ore has been developed in the property of the Mazatzal Copper Co., in the Tonto Basin country. Tunnel No. 1 is in 110 ft., and the Bullfrog tunnel is in 225 ft. A compressor has been ordered and air-drills will be used.

GRAHAM COUNTY.

Work has been resumed on the Sierra de Oro mines above Clifton. The principal development work has been done through tunnels.——The New England & Clifton Copper Co. netted about $70,000 on shipments of ore during the first three months of this year. Ore shipments were made from the Antietam, Buckeye, Copper, Regulation, and Copper King claims. The net amount received from the smelter per ton of ore shipped, according to the reports, was $21.66 per ton. A surface tramway is being built from the Antietam mines to the Shannon mines, in order to give the company an outlet to the Coronado railroad. A new 250-h.p. compressor will soon be installed. Alex. Veitch is the manager for the company.

MARICOPA COUNTY.

H. A. Hughes has taken over the entire interest in the Verde Queen mine, which is situated on the Verde river, 50

Map of Arizona.

miles north of Phœnix, and will start a force of men to work at once. The plan is to float the ore down the Verde and Salt rivers on barges, during high water.

PIMA COUNTY.

It is reported that good ore is being opened in the Helvetia property. The main shaft is more than 1,000 ft. deep.

PINAL COUNTY.

Reports state that a rush has been started by the news of a strike of placer gold near the head of Steamboat Springs cañon on the southern slope of Dripping Springs range, two miles southeast of Troy. The discovery was made by Mexicans, who have been dry washing.

CALIFORNIA.

AMADOR COUNTY.

A drift is being run on the 240-ft. level of the Defender mine, toward the intersection of the veins. Some good ore is being taken out and the mill will be started at once.—— The Tom and Dick mine, near the Defender in the Pioneer district, is considered a good prospect. S. P. Sharpless of Massachusetts has been examining it.——The miner's union at Jackson has voted not to take any drastic action on the refusal of the operators to recognize the union, and will await further developments.

CALAVERAS COUNTY.

The Eazybird mill in this county is producing a good grade of concentrate, that is being shipped from Martell to the Selby works.——The mines at Angels are all closed down, and several hundred men have left the town for Vallecito, Goldfield, and other camps.

EL DORADO COUNTY.

Some good specimens of ore have been found in the Crystal mine at Spanish Flat.——It is reported that rich gravel has been struck in the Delwisch mine in the Georgetown district.——The new 125-h.p. air compressor for the Sherman mine has arrived.——The Taylor mine in the Garden Valley district is being unwatered to the 200-ft. level, and examined. Herrup & Boski have a bond on it. ——A hoist will be installed at the Short Handle mine in the Spanish Dry Diggings district, owned by Lewis Sites.

NEVADA COUNTY.

Copper ore is being hauled from the California mine at Spenceville, to Wheatland, from which point it is shipped to the smelter at Kennett.——The Fairview mine, in the northern part of this county, is looking well. A good vein has been opened that assays from $4 to $8 per ton.——F. M. Spaulding has been examining the Richland mine, which is situated on Cement hill and is an extension of the old Manzanita gravel channel, near Grass Valley. ——The Morning Star mine has passed into the control of Bacon & Sweet of Oakland. This is considered a good prospect and a new surface equipment and pumping plant will be installed. E. E. House is the new superintendent, and the shaft on the Morning Star claim will be sunk 300 ft. deep, and the Badger Hill properties will be prospected through this shaft.——The mill of the Mountain View company, on Canyon creek, a few miles above Washington, will soon be running again, as the pipe-line has been repaired.——Freight is being hauled to the Grant King mine near Washington. A 20-stamp mill will be built at once. C. M. Carter is the superintendent, and 20 men are employed. A large low-grade vein is being developed.——A six-foot vein of quartz has been struck in the bottom of shaft No. 2 of the Gold Mound Mining Co.'s property on Deadman's Flat. The mine is owned by Spokane men, and has been developed by an 80-ft. shaft.——The Yuba and Mayflower mines at Maybert are being systematically reopened. C. S. Marriner is the manager and L. S. Strickler is the superintendent. About 20 men are employed, and a tramway is being built to connect the Mayflower mine with the mill on the South Yuba river. The mill has been entirely rebuilt and 10 new stamps added. The Yuba shaft will be unwatered, it having been idle since the Haggin and Hearst people abandoned it many years ago, after sinking 960 feet.

PLACER COUNTY.

The vein at the 1,200-ft. level in the Three Star mine is three feet thick and the ore is of good grade, 35 men being employed underground.——The new shaft at the Bellevue has been finished.——Three tons of ore from the Argonaut mine at Ophir yielded $1,880 to George Cooper.——The Rawhide company will run a tunnel 500 ft. lower than the present one. About 15 men are employed at the mine.—— A flume is being built to the Black Hawk mill on the north fork of the American river, preparatory to starting.——The Excelsior mine will soon be reopened by Denver people, and a large force of men will be given work.——At the Hidden Treasure mine 30 men are employed. The tunnel has been run 1,100 ft. Three men are prospecting on the Homestake mine in Volcano cañon. There is a 500-ft. tunnel, and a five-stamp mill is on the ground.

SHASTA COUNTY.

The bunkers on the branch railroad to the Hornet mine will be completed within a week, and shipments from the Hornet to the Keswick smelter will begin at once. Only one furnace is working at the smelter, but two others are ready to blow in.

SISKIYOU COUNTY.

The mill at the Czarina mine on Taylor creek is running continuously. C. W. Wolff is the superintendent.——A new quartz vein has been discovered by H. B. Wintering, while prospecting at the head of Applesauce gulch in the Liberty mining district.——At the Highland mine, a crosscut tunnel will be started on the China gulch side to tap the vein at a greater depth. Louis H. Cory is the superintendent.——J. M. Morrison is sinking an incline shaft on the Luke Shaw vein in Quartz valley.——A. F. McClaine of Tacoma is a partner of A. C. Brokaw in the Golden Eagle mine on Indian creek.——A. W. Graham, who built the Yreka dredge, has gone to Callahan to erect the Bucyrus dredge at that place.——The McKean mine, near Callahan, is looking well. The vein has widened, from two to five feet and runs well, cyanide treatment being used in milling it. At present, 40 men are employed and more are needed. ——Scott & Graves have bonded the old Bogle mine, and will sink on the vein.——The Summit and Golden Jubilee mines will be opened in a few weeks.——The McKinley Mining Co. is working a full force and keeping the 10-stamp mill busy.

TRINITY COUNTY.

The 40 stamps at the Bonanza King are dropping. The 5,000-ft. tramline is working well, and 65 men are employed in the mine. No clean-up has been made since the mill started, but a good yield of bullion is expected.

The Bear Tooth mine has been reopened. The mill was moved 1,500 ft. nearer to the mine.——The clean-up for the first month's run of the new 40-stamp mill at the Bonanza King mine was said to have been satisfactory. Joseph Porter is the manager for the Treadwell Brothers, at the mine.

TUOLUMNE COUNTY.

The new wire cable across the river at the Ellen Winton mine, is ready for use.——The Big Casino G. M. Co. recently granted the employees of the Mack mine an eight-hour day. This action was taken without any demand on the part of the miners. The mill, at Big Oak Flat, is running steadily, and the big compressor at Chinese station is working.—— R. B. McGinnis recently examined the Wide West prospect.——A suit has been started by the Rawhide G. M. Co. against the Dutch M. & M. Co., alleging that the latter company drove from a shaft on the Dutch mine, at Quartz Mtn., into territory pertaining to the App mine, and extracted through the deep workings, 20,000 tons of ore. The damage is placed at $150,000.

YUBA COUNTY.

The Marysville Gold Dredging Co. will build a third dredge, and the machine-shop will be enlarged to twice its present capacity. This company has had two dredges working for more than a year.

IDAHO.

BLAINE COUNTY.

Some silver-lead ore has been struck near Hailey, two miles southwest from the North Star group.—— On the Battle Ax claim the ore lies in the contact of limestone and quartzite.—— Stephen Coles, from New York, has been in Hailey looking into the affairs of the Idaho Mining & Improvement Co. It has developed that out of the $40,000 paid into the treasury, only $3,000 was spent on the property at Muldoon.——There are 60 men working in the mines of Tustin & George at Muldoon. A mill is being built and labor is in great demand, $4 for eight hours being the standard pay.——The Eureka mine, at Placer, is showing from six inches to two feet of galena on the 400-ft. level. Several carloads have been shipped. The property is owned by Salt Lake parties, and W. A. Wilson is the manager.—— The Garfield mine, a producer 20 years ago, is showing some good ore in development. The property is situated across the ravine from the Eureka mill. It belongs to Capt. Guyer, of Valparaiso, Chile.

OWYHEE COUNTY.

Work has been resumed in the raise in the Webster tunnel on the Banner property, to connect with the upper Banner tunnel, a distance of 216 ft. Development work in the north and south drifts is progressing satisfactorily.—— The ore-shoot in the No. 2 south drift of the Potosi continues from 10 to 18 in. wide, carrying good ore. The

Knickerbocker raise will be finished within a few days.—— The directors of the Village Blacksmith Mining Co. have recently visited the mine. New machinery will be installed. ——Supplies are being hauled to the Camp Bird mine on North Sinker creek, where a two-stamp experimental mill will be installed.

SHOSHONE COUNTY.

(Special Correspondence).—Seventeen million dollars, netting profits of $6,436,756.03, is reported to be the gross yield of eight of the big producing mines in the Coeur d'Alene district for 1906. In the sworn statements to the assessor of Shoshone county, required under the new State law, the cost of extraction was $4,329,517.52, upon a tonnage of 1,521,551. The cost of the transportation, reduction, and sale of the produce amounted to $4,652,436.90 and the improvements $930,335.20. The Federal Mining & Smelting Co. with its four mines, the Morning, Standard-Mammouth, Tiger-Poorman, and Last Chance, holds the record, with a gross production of $7,775,770 and a net profit of $2,685,213.76, but the Bunker Hill & Sullivan surpasses all in the record for a single mine, the gross yield being $4,771,748.35 and the net profit, $2,264,389.22.——The reports show that the ore from the Snowstorm mine was treated much cheaper than any other properties in the group, while the Hercules is the richest. The Frisco, Hunter, and Tamarack-Chesapeake report losses for the year. This is due to the development work being under way at these mines during the year and but little ore being shipped. The Frisco reports improvements of $122,021.46, included in which sum is the unwatering of the mine. Its net loss is given out at $117,389.56; the Hunter, $89.26 and the Tamarack-Chesapeake, $10,234.09. ——Another strike has been made in the Snowstorm mine near Mullan, the ore being encountered in No. 4 tunnel, which is being run 3,500 ft. to get the main vein. The tunnel is now in 1,600 ft. and has broken into what appears to be an immense lode. The workings first encountered a seam of talc four feet thick, and then entered decomposed vein-matter, so soft that the timbers have to be kept up to the face to prevent caving. The mass, which has been cross-cut for 20 ft., carries copper, galena, and lead carbonate.—— The Bunker Hill & Sullivan M. & C. Co., operating a silver-lead mine at Wardner, declared dividend No. 116, amounting to $180,000 for May. This is the company's regular monthly dividend and brings the total amount of dividends paid since Jan. 1, 1907, to $900,000, and total to date, $8,766,000.—— Another strike has been made near Wallace, on the property of the Chicago-Boston Mining Co. The vein was found in a 25-ft. cross-cut, at a depth of about 80 ft., and the second wall is not yet in sight. The ore is of good milling quality, rich in silver and lead. The vein will be cross-cut until its full width is exposed, after which it will be explored with drifts.——Reports are current that the directors of the Snowstorm Mining Co. have decided, in case all goes smoothly at the mine, to disburse a total of 45c. per share in dividends between May 10 and Jan. 1, 1908. The condition of the mine, the funds on hand, and the returns from the ore all justify such a rate, it is said. Present plans are to pay 5c. per share May 10, June 10, and July 10 and 6c. per share on the 10th day of each remaining month in the year. This will entail the distribution of $675,000 in dividends during the next eight months.—— Stockholders of the Pittsburg Lead M. Co., owner of the Black Cloud mine on Nine Mile creek, will pay a dividend this summer, probably in June.——Another strike has been made in the Golden Chest mine, near Murray, that seems to prove the richness of the property. The vein was encountered in a cross-cut 30 ft. east of the main tunnel, and 3,000 ft. from the portal. The vein is said to be seven feet wide from wall to wall in ore.—— W. T. McHatton of Butte, acting on behalf of the Northwestern Ore Purchasing Co., has arranged with the O. R. & N. company for a piece of ground, 125 by 500 ft., on the railroad tracks below Wallace, where $25,000 will be expended in the erection of a custom sampling works. The building will b 40 by 96 ft., and will be equipped with sample machinery to handle 200 tons of ore every 24 hours. The plant will be ready in July.

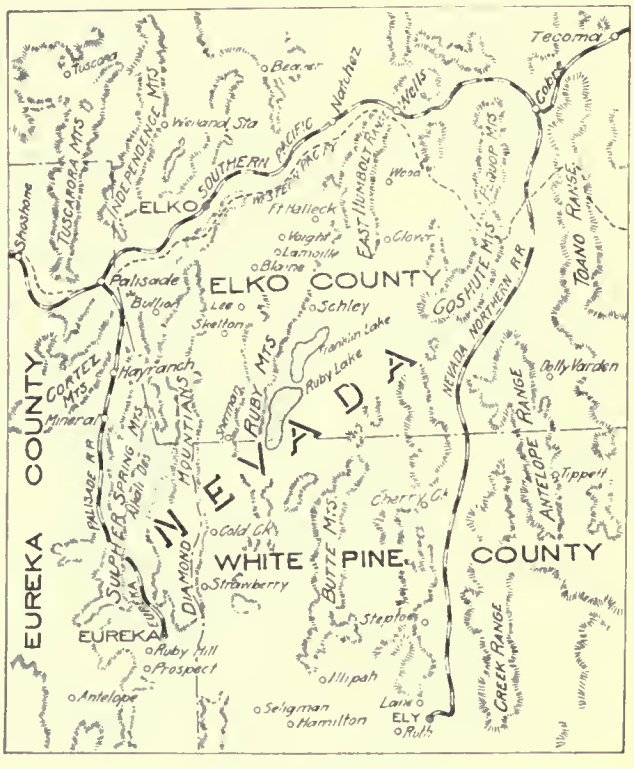
Spokane, May 25.

BEAVERHEAD COUNTY.

The Dillon-Argenta Mining Co. has begun work on one of the company's claims below Argenta. A shaft will be sunk 100 ft., being at present 30 ft. deep, with ore carrying gold, silver, and copper showing in the bottom.——The new smelter of the Silver Fissure Mining Co., at Polaris, will be blown in soon. Henry H. Armstead, Jr., is directing the affairs of the company. The traction-trains are taking in coal and supplies from Armstead to Polaris and everything at the property is in readiness for starting.——Some good silver ore has been struck in the Kent mine of the Butte & Dillon company. Shipments will commence June 1, good ore being stoped in a 35-ft. winze 900 ft. from the portal of the tunnel.——Active work is in progress at the property of the North Dakota Mining Co., near Polaris. T. E. Farnham, of Carrington, N. D., is president and Dan Burkholder superintendent.

FERGUS COUNTY.

A good orebody has been developed in the property of the North Moccasin Gold M. Co., at Kendall. A drift has been run in ore for 300 ft. and a winze sunk 150 ft. on the vein is bottomed in ore.——A good deal of development work is



Map of Eastern Nevada.

being done on the Collar Gulch property, near Maiden. Frank Weeks is the manager.——A new strike is reported in the Cumberland mine at Maiden. Engineers have reeently examined this property for Butte and Chicago parties.——Work has been resumed on the Sunrise group, near Maiden, and shipments will probably be started this summer.

NEVADA.

HUMBOLDT COUNTY.

(Special Correspondence).—A good strike of ore running 800 oz. silver per ton, with a little gold, has been made in the Big Six group. The vein has been traced 250 ft. and is about four feet wide. It is reported that the group has been secured by the Schwab interests.——The Rosebud Syndicate M. Co. has uncovered a vein from which picked samples run $35 gold, $30 silver, and 10% lead. A cross-cut has been driven 22 ft. and the wall has not been reached. ——Ore running $50 in gold has been struck at a depth of 20 ft. in the Gold Anchors mine. Three cross-cuts have been driven to tap the shoot.——At the Brown Palace excellent ore has been encountered and a good lode has been exposed. Several men are engaged in development work and the mine is showing up well. The property is owned by Charles M. Schwab and friends.——William Beeley an

John J. Langan have located oil land 10 miles southeast of Rosebud, and are planning to commence boring in the near future for oil. R. M. Edmunds, an experienced oil operator, states that the indications are excellent.——Work has commenced on the Stock Exchange building, which will be a two-story structure.

Rosebud, May 22.

LINCOLN COUNTY.

(Special Correspondence).—Seven mines in this district are shipping ore.——Good ore has been encountered in the 150-ft. level at the Ajax-Bullfrog and is being blocked out. The silver is diminishing, while the gold is becoming more plentiful. The high-grade rock is being shipped to the smelter, and the low-grade is stored on the dump. The new mill will soon be erected.——At the Searchlight Gold Extraction, active work has been resumed. A prospect shaft is being sunk on the vein, which is three feet wide on the surface. E. G. Woodworth is superintendent.——The main shaft on the Big Tiger is being sunk to the 400-ft. level. A strike was recently made on the 250-ft. level and good ore was found.——At the Nevada Crescent, high-grade ore is being sacked, and the three-foot vein is being developed. The ore was found at a depth of 15 ft.——Good ore is reported from the Double Standard.——The winze in the Syndicate tunnel at the Golden Crescent is in good ore, and the vein which recently faulted has been found. A. J. Waddleton is in charge of the mine.

Crescent, May 21.

(Special Correspondence).—The New York Searchlight company will build a 10-stamp mill on its property. It has also purchased a 50-h.p. four-cylinder Union hoist, a 12 by 12 air-compressor, power drills, ore cars, rails, and double-deck cages. These are the first cages to be installed in the district, skips invariably being used. Power from the McCready electric plant at the Santa Fe mine will be utilized for the compressor, and the shaft and buildings will be lighted by electricity. A diamond-drill outfit has been ordered.——On the Golconda, which adjoins the New York Searchlight, a 15-h.p. hoist, a 6 by 6-in. air-compressor, and Little Wonder drills have been ordered.——At the Searchlight Belle, the shaft is down 175 ft., and is being driven on the vein, which started at about 65°, but at 120 ft. changed to 85°. This shaft has opened five feet of vein-matter, of which three feet is pay. The Searchlight Belle is near the Wyoming Searchlight, where on the 200-ft. level a 30-ft. vein was opened; and also adjoins the Santa Barbara, Golden Rod, and Searchlight Western.——Another property being developed by R. H. B. Warburton is the Ajax Bullfrog mine at Crescent, where some good ore has been cut. The shaft is in ore, of which an 18-in. streak runs well. This rich streak is on the foot-wall. Levels are being started at various points in the shaft, and they will be driven on the vein.——The Searchlight Gold Dollar M. Co. will commence development on the Yellow Rose claim. This property adjoins the Gold Dyke and Golconda and is north of the Colorado M. & M. Co.'s property. In the present 40-ft. shaft, a fair showing has been encountered. Cyrus S. Chapin is the president of the company.——The Calavada M. & M. Co. will begin operations on its ten-claim group, 12 miles north of Searchlight. R. L. Blackburn is the secretary of the company. The company's holdings are well situated near the St. Louis mine, which has been a producer. The property is developed by a 4 by 6 shaft, which is now down 60 ft. At the bottom of the shaft there is a three-foot vein.——The shaft on the Searchlight Midas, in which 100 ft. was recently contracted for, is nearing the water-level, and the orebody is showing up well. When the additional 100 ft. is added, a drift will be run into the vein, east of the shaft.

Searchlight, May 17.

WHITE PINE COUNTY.

The Badger shaft of the Ely Mines Co. has been sunk to the 100-ft. point in 30 days.—— There are 30 men working on the Chainman shaft, which is being sunk vertically, with two compartments, alongside the old incline shaft.—— The Ely Consolidated continues to ship high-grade ore from the Sunshine shaft.—— The foundations for the ore-bins of the Star Pointer have been started.—— The Butte & Ely company has resumed sinking in the April Fool shaft.—— The boiler is in place at the Beehive shaft of the Butte & Ely.—— W. R. Miller and W. A. Williams have given a short-time option on their group of 18 claims in the Tamberlaine district to Eastern capitalists. These claims are 10 miles east of Ely.——In another two weeks the Keystone tunnel, being driven by the Nevada Northern in laying track to the Star Pointer, will have holed through.——The Giroux company is hauling a consignment of 35% copper ore from the Alpha shaft to the railroad for shipment to Salt Lake smelters. The shipment will be about 300 tons. ——The Mizpah Con. G. & C. Co. has begun work on a new tunnel on the Nevada Northern vein, which will tap the lode at a depth of 200 feet.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Hidden Fortune and the Columbus Consolidated mines at Lead, have been consolidated under one management. Bonds for $400,000 have been issued to further develop the properties. The consolidation was brought about through the foreclosure of a bond issue of $250,000 on the Hidden Fortune mine, by the Continental Trust Co. The office of the company will be in New York.

WASHINGTON.

CHELAN COUNTY.

Excitement prevails at Chelan over the discovery of veins on Chelan Butte, carrying gold, and a stampede is now on to the scene of the find. Specimens show stringers of free gold in large quantities. Miners say that the ore resembles Cripple Creek ore. The veins are well defined, and a large number of claims have been located.——Spokane mining men give credence to a rumor from Chelan that Jay P. Graves has plans for the organization of a $5,000,000-company to take over and develop the various projects in the Chelan district on which he now holds options. The plan, as reported, is that the company shall own and operate the Holden mine, the electric road from the mine to the shores of Lake Chelan, a line of steamers on the lake, an electric railroad connecting the foot of the lake with the Columbia river, and a smelter at some point on the lake or the river.——J. A. Goulden of New York, announced in Spokane that he and his associates will build a railroad from the Red Mountain mine in the Chelan country to the Great Northern main line, 26 miles north. It is stated that this mine is one of the richest copper properties in the Northwest. Work on the road will be begun at once, and, as soon as it is finished, ore will be shipped from the mine to the Tacoma smelter.

FERRY COUNTY.

Official announcement is made that the Belcher Mountain Gold & Copper Co. will build a railroad from Belcher Junction to its camp, in northeastern Washington; also that a 500-ton smelter will be installed this summer. The mines which will contribute to it are the Belcher, Copper Key, Bortel, Oversight, Iron Queen, Midnight, and a half dozen others. New machinery is being placed on the Oversight. When ready, a shaft is to be sunk to a depth of several hundred feet on one of the claims belonging to the company.——The Winnipeg is installing a seven-drill Rand compressor. The vein is a large one, and carries copper-gold ore.——The Bridge Creek Mining Co., which has 100 acres of mineral ground 15 miles north of Keller, the groups comprising the Midnight, Veda W., Gold Crown, Silver Pack, and Number Seven, has driven the tunnel 246 ft. D. H. Wells is the superintendent. The company is composed of Iowa and Spokane people. The president is E. H. Arthur of Scranton, Iowa, while A. L. Braley of Spokane is secretary and treasurer.

OKANOGAN COUNTY.

The Twisp Gold-Copper Mining Co., the control of which is held by Glen B. Creighton and Frank R. Creighton of Spokane, has let a contract for a 150-ft. continuation of the 80-ft. cross-cut on the company's property, 20 miles from Twisp. The cross-cut is passing through country rock

which assays $5 per ton in copper, returns as high as those obtained from much of the Granby ore.——John Thomas, under whose direction the Salmon river mine on Peacock Mtn. in the Okanogan country, northwest of Spokane, is being developed, is authority for the statement that a tunnel from 3,500 to 4,000 ft. long will be run. This long cross-cut will drain the mine, and will afford a most economical outlet for the ore. Work will be begun this season. A raise being run from the present lower tunnel has proceeded 124 ft., 109 of which is in ore. The property is owned by Minneapolis capitalists, and R. A. Hutchinson of Spokane also owns an interest.——Two feet of ore, carrying about $40 per ton in copper, has been cut in the property of the Multnomah M., M. & D. Co. at Nespelem camp. The ore was cut in the east drift from the long cross-cut tunnel which is now in 1,000 ft. Another strike was recently made at a depth of 10 ft., on a claim recently located for the company. The ore at that shallow depth gave returns of $37 per ton. F. O. Hudnott, the general manager, says they will continue the long tunnel another 1,500 ft., as there are a number of veins in the mountain to be explored. The cross-cut has already exposed four veins. They have the water-power of the Nespelem river, which they will develop this summer, to install electric power for the mines.

MEXICO.

CHIHUAHUA.

Gold bars valued at $130,000 have just been received in Chihuahua from the Batopilas Mining Co., for shipment to New York. The Waterson company at Ocampo sent a $13,000 shipment.——Rumors are circulating to the effect that the U. S. M. S. & R. Co. has bought the San Pedro mine of the Cia. Minera de Naica, for 6,500,000 *pesos*. This may result in a smelter being built at Jimenez. Also, it is rumored that the Ramon Corona mine at Naica has been sold to George Carothers of Torreon for 200,000 *pesos*.——A great many complaints are being made against the Palmarejo & Mexican Goldfields Ltd., an English company operating in the Chinipas district in western Chihuahua. The reports are that this company is trying to keep mining men out of the district.——The new 50-ton experimental plant of the San Francisco del Oro mines in the Parral district will be running by August 1. James E. Hyslop is the manager for the company.——Charles M. Schwab is reported to have paid $1,000,000 to D. Manuel Gameros for the Central Juarez, and mines in Sta. Eulalia camp, 15 miles from Chihuahua. The Central property consists of 146 *pertenencias*, and the Juarez of 31.——The annual report for the Batopilas Mining Co. for 1906 shows a net surplus of $314,337. The capital stock of the company is $9,000,000, and there are outstanding 6% gold bonds for $459,700.——The 80-stamp mill for the Quebradillas mine in the Minas Nuevas portion of the Parral district, being built by the Cia. Industrial Mexicana, will be in operation by September 1. John W. Conner is the manager for the Veta Colorado M. & S. Co., which owns this property.——The new mill for the Santa Barbara silver mine of the Cia Minera de Rio de Plata, beyond Guazapares, is all ready to start. D. W. Shanks is the manager

COAHUILA.

A company of Texans is running a 2,000-ft. tunnel on the property in El Aguas district, west of Castando. The tunnel is now in 1,400 ft. and when completed will cut the vein 800 ft. below the workings of the mine. E. L. Swasey is the manager.

DURANGO.

The MacDonald Brothers have purchased La Perla mines in the Topia district of Durango, near the Sinaloa border, for 300,000 *pesos*. A company will be organized and a mill built.

SONORA.

About 20 miles northeast of Hermosillo, the Sonora Bi-Metallic Mining Co. is operating Las Animas mine. Several shafts are being sunk, the main one being 150 ft. deep. A. J. Nickel is the manager and J. Cransford the superintendent.——Shareholders of the International Copper Mining Co., from Kansas, have been visiting the property, about 45 miles northwest from Hermosillo.——The Tezopaco Copper Co. is developing copper properties in the Alamos district, between Movas and Tezopaco de Rosario. W. W. Harper is the superintendent. The ore will be shipped to the National Metal Co. of Hermosillo.——C. B. Ward is developing Los Tajos mine, near Escalante station, below Torres. This property was once a producer, but has filled with water.——The enlarged mill of the U. S. A. syndicate at Tortuga, 25 miles east from Hermosillo, will start June 1 with a capacity of 90 tons per day.——The shaft is down 100 ft. on the Animas mine, near Llano station.——The Sonora Quartz Mines D. Co., operating La Yaqui and El Tiro mines at La Yaqui in the Altar district, has suspended operations, and it is reported that a consolidation may be effected with the Reina de Oro Mining Co., which owns adjacent properties.——A new hoist and boiler will be installed at the South Cananea No. 2 shaft.——It is reported that New York and Philadelphia people have bought the Cananea Eastern property, in the Cananea district.

CUBA.

Consul R. E. Holaday, of Santiago, transmits a report on the mining industry of that part of Cuba, which follows: Mining is one of the principal sources of wealth of the province of Santiago de Cuba, owing to the abundance and accessibility of the minerals. Iron is the most abundant, but copper and manganese are found in sufficient quantities for profitable exploitation. Gold, lead, zinc, and asphalt are also said to exist, but so far there has been no development of any of the mines said to contain these minerals.——Four principal companies are engaged in mining and exploiting minerals. From the mines at Daiquiri, 3,536,121 tons of ore were produced to December 31, 1906. The production for the year 1906 was 510,500 tons. The ore has all been shipped to the United States, except about 75,000 tons, which went to England, Germany, Belgium, and Cape Breton, Nova Scotia. The Daiquiri ore, which is red hematite, occurs on the hillsides, usually near the top, and the mining is all open-cut work, more in the nature of quarrying, the only underground work being the exploration tunnels. The company also owns several iron mines on the north coast, in the Mayari Mtn., back of Nipe bay, and is about to commence the construction of a broad-gauge railroad from the mines to the bay at Cagimaya, at which place will be built two wharves and other necessary equipment for economically handling the ore and exporting it to the United States. It is estimated that it will be possible to ship 1,000,000 tons annually.——Another American company operating near the Daiquiri mines shipped its first ore in 1884, since which time about 5,000,000 tons have been produced, nearly all going to the United States. The ore is transported by rail from the mines to Santiago bay, where the company has a fine steel pier.——Copper deposits exist throughout almost the whole of the southern portion of Santiago province, but so far the only attempt that has been made to mine it for exportation is in the vicinity of El Cobre, about 15 miles west of Santiago. A deposit of extraordinary richness exists in this territory. It is said that during the 23 years El Cobre mines were operated more than $50,000,000 worth of copper was produced. The works were entirely destroyed during the war of 1898. In 1902 an American company purchased them and began to drain them by means of enormous steam pumps. The expense of this operation was greatly reduced by forcing the water in the mines through a system of tanks filled with old iron, whereby the copper which it contained was precipitated in the form of a cement. At tide-water on the bay, the company erected reduction works, comprising a smelter and concentrator, the latter having a capacity of 300 tons per day. Owing, however, to a series of accidents at the mines, whereby the output has been greatly curtailed during the last year, these are not in operation now. The copper contents of the ore mined is about 5%. The company operates about 12 miles of railroad, extending from tide-water on the bay to the mines.—— During 1906, iron of a value of $2,210,331, was shipped; manganese, $83,000; and 24,558 tons of copper ore, valued at $330,236.

Special Correspondence.

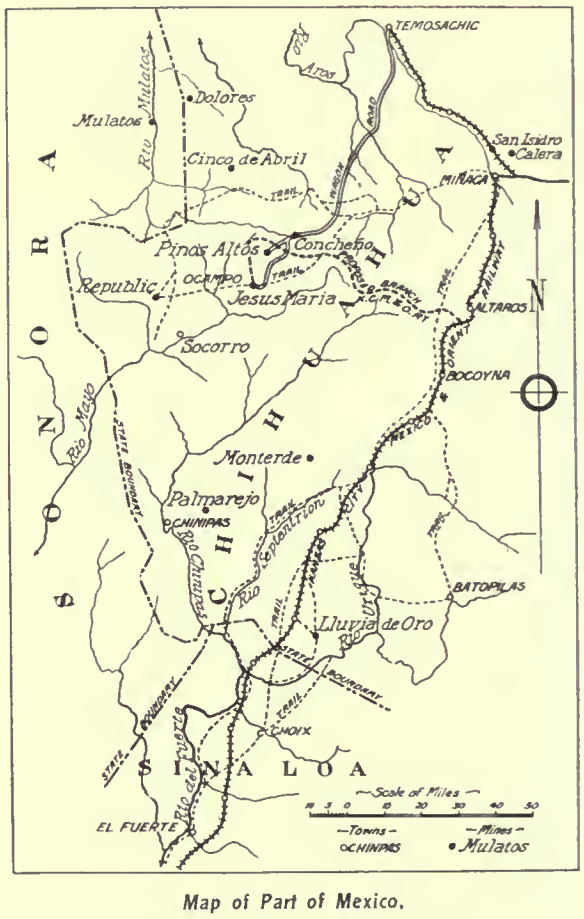
London.

Dolores Quarterly Report.—Difficult Conditions.—Another Mexican Company. — Esperanza to Mill Entire Output. — Penn-Wyoming Copper. — Deep Leads in Victoria. — Siberian Mining and the Interest in It.

Dolores Limited has issued a report for the three months ending March 31. There were 3,563 tons of ore treated in the mill, of this 770 tons underwent pan-amalgamation and 2,793 were cyanided; the average value per ton was $50. The production for the quarter realized $131,000, the estimated profit therefrom being $64,000. January and February milling included a small quantity from the dump. The residue from the slime-plant in January assayed $3.50 to $4 per ton. The total capacity of the mill is reported as 75 to 80 tons of ore per 24 hours, all to slime, but the slime-plant can only handle 50 to 60 tons of this per day until the Butters filter is installed. Some progress was made with the improvements to the mill; foundations for the concentrators were completed; the Dorr classifier and Frenier sand-pump were installed; two Wilfley tables were put in successful operation in March; the concentrate produced therefrom assayed 20 oz. gold and 870 oz. silver per ton. The new tube-mill was being riveted together and would require a month more to complete. Regarding the mine development, the report states that on the fourth level the assay-value dropped to $5 and $10 per ton 70 ft. north from the shaft. After driving 25 ft. farther, a cross-cut was put into the north wall. This broke into ore two feet wide assaying 9.48 oz. gold and 273.92 oz. silver per ton, yielding an average as sent to mill of $93 per ton; 20 ft. from this point the value as broken in the level was $30 per ton. The entire drift was in ore without walt on either side. The ore at this (the deepest) level is well suited for cyanide treatment, as no increase of sulphide is indicated. In March, a farther advance north of 32 ft. was made, the ore lowering in value to $7 and $10 per ton. The manager thinks they have been driving in a lean part of the lode, which is wide, and that the rich ore is probably in one of the walls. He has started a cross-cut to test this. It is thought there may possibly be 300 ft. farther to drive before reaching the San Francisco vein. On the New (No. 2) vein in the San Francisco cross-cut, a drift was started in January. Assay of 6-in. solid streak gave 1.84 oz. gold and 625.75 oz. silver. Another assay showed 2.26 oz. gold and 332.72 oz. silver. The present working on this vein has developed a short shoot, 30 ft. long, which will average 8 in. sold mineral, worth $329 per ton, or an average for the full width of the drift, including the rich streak, of about $40. The labor and freight conditions still worry the manager at Dolores. In January the labor supply was fairly good, but in March the conditions were less favorable. The manager reports: "This being the planting season, a number of our miners and trammers have left, which makes us very short of labor. The labor condition still continues serious and it will probably be necessary to limit the development work and put some of the men to mining. This shortage of men adds to our difficulties, as we are compelled by necessity to use men whom we would not use, could we do otherwise." As to freight, great trouble was experienced in February in getting supplies over the Mexican Central railway, which is lacking in both cars and locomotives. The low production in February was due to the shortage of cyanide from this cause, and the delay in freight continues to hamper progress in both construction and mining.

Under the auspices of the Venture Corporation, the Mexican Mining & Industrial Corporation Ltd. has been formed with a capital of £153,750 in 150,000 ordinary shares of £1 each and 75,000 deferred of one shilling each. There is no public issue. It is understood that the new corporation has already in hand the flotation of an important enterprise in Mexico.

A new departure has been taken by Esperanza management. As it is absolutely impossible to secure an adequate supply of cars from the railway, they have decided to mill all the ore at the mine. This, they state, will reduce the monthly profit, but it will increase the profit per ton treated, thus securing larger gain spread over a longer period. The results of the working operations and developments of the mine for the period from January 1 to March 31 this year have been published, the net profit for the quarter, after deduction of all expenses in Mexico and New York, having been $453,903.



Map of Part of Mexico.

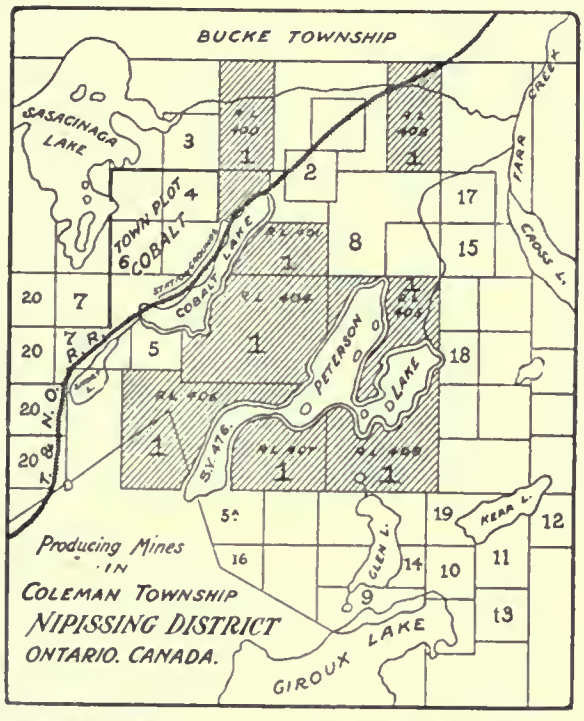
Showing the position of the Dolores mine.

The fortnightly report to the end of April last of the Penn-Wyoming Copper Co. has been issued; it shows that the Company has made £62,700 net profit since the new re-modeled smelter started on March 15 last. This works out at an average of £10,450 per week for the six weeks. The secretary states that the daily output will not be increased until the branch railroad connecting the Company's works with the Union Pacific railway is completed next month, but even on the present earnings the Company could pay 27% on the entire issued capital. It is also said that the new re-modeled 1,000-ton smelter is working well enough to give the Company a net profit of £70 per ton on its output at present market prices. The *Globe*, in publishing this information, remarks: "Penn-Wyoming shares have been largely bought both in London and Paris, and the foregoing information ought of prove of more than usual interest to holders." Having regard to these particulars there must be some "hard swearing" somewhere if what T. S. states in the

MINING AND SCIENTIFIC PRESS of March 23 has foundation in fact.

According to the latest news from the general managers at Melbourne to Loddon Valley Goldfields Co., the miners were driven out by a rush of sand when opening into wash in No. 1 cross-cut south at the 454-ft. level. "Main cross-cut east—Wash has been entered, but too much gas and water for continuing work for week or so. No. 3 rise driven in wash 198 ft.; average, 8 dwt. 19 gr. per fathom. No. 4 rise 19 ft.; average, 4 dwt. 13 gr. No. 5 rise 110 ft.; average, 13 dwt. 14 gr. per fathom." Gas and water have hitherto been all too prominent a feature in this company's operations, but the promise of gold from the wash appears now to become nearer of achievement.

In your issue of April 13, C. W. Purington complains that the editorial blue pencil has not done its work on my correspondence when it has happened to refer to Siberia.



1. Nipissing Mines Co.
2. La Rose Mining Co.
3. Trethewey Silver-Cobalt Co.
4. Coniagas Mining Co.

After such "waste of space" it is somewhat remarkable that Mr. Purington should occupy a whole column on the subject himself. Your London correspondent does not write for the purpose of inducing "the American" to "follow the Londoner in Siberian investments." His object is simply to reflect what is passing in London at the moment—not to offer any "apology" or "defense" for Siberia or any other mining field. Mr. Purington states from personal acquaintance with the country (a privilege denied to the ignorant "average Londoner") that Siberia "contains one of the world's greatest stores of accessible gold" and that "the American engineer today who acquires a working knowledge of the Russian language will add a valuable asset to his equipment." Is it then really true that Americans have no use for news of what is doing to develop the wealth of other countries, because their own country is rich in mineral resources? This is parochialism with a vengeance—the village pump *in excelcis*. In the present day any country however "remote" can exert an influence on the world's commerce by its output of the precious (and other) metals. To show that the superior person is not always the best informed, your correspondent may mention that he has indisputable authority for disproving Mr. Purington's assumption that the "American investor" takes no "practical interest" in Siberian mining. As to the lack of "discrimination in the investments" due to the "utter ignorance" of the "average Londoner"; is this peculiar to Siberia? Has it not happened that Londoners have put their money on investments "nearer home" concerning which not only the said Londoners, but also the local experts who advised them, have shown a lamentable lack of judgment?

Toronto, Canada.

Government Report on Mining.—Institute Meeting.—Shipments From Cobalt.—Latest News From the Mines.

The Canadian Department of Mines has authorized the collection of authentic data for a detailed report on the mining and metallurgical industries of Canada. It will include only mines producing and those undergoing development and metallurgical plants. Full information will be given concerning the operating companies, the character, quality, and source of the raw material, nature of the output, methods and processes employed, and cost of production. The frequent enquiries for such information have shown the need of the publication. R. R. Hedley, of Nelson, B. C., has been appointed to collect the data for British Columbia and the Western provinces.——The annual convention of the American Institute of Mining Engineers will be held this year at Toronto, commencing July 23, a cordial welcome on behalf of the province having been extended by Premier Whitney. After the convention, which will occupy two days, a trip under Government auspices will be made to Cobalt, where a couple of days will be spent in examining the mines. Opportunities will be afforded to visit the Sudbury district and the Hutton iron range, and other side trips may be arranged including the country on the Hudson Bay slope.——R. W. Brock, who has had a wide experience of the mining industry in British Columbia, has been appointed by the Provincial Government of Ontario to make an examination of the Larder Lake area, and report as to its nature and possibilities.

Shipments of ore from Cobalt for the week ending May 18 amounted to 198 tons. The shipping mines were Coniagas, 85 tons; O'Brien, 85; and Temiskaming, 27 tons.—— The Foster mine has been rather under a cloud lately, and reports to its discredit have had a depressing effect on the market. A complete change of management was recently effected. John G. Kent, the new president, and Joseph Oliver, a director, have gone to Cobalt to arrange for a careful examination of the property. Frank C. Loring, consulting engineer, has been retained, and a thorough report will be presented.—— John Harris, mine captain of La Rose, has been replaced by W. H. Jeffries, a Western miner.—— A strike has been made on the Silver Bird property at 115 ft., showing native silver and smaltite.—— On May 23 an important discovery was made on the University property, now owned by La Rose interests. It comprises a perfect network of veins of pure native silver, the rock around each vein being broken and loose, indicating that they probably meet in one large vein. A strip of about 10 ft. has been uncovered.—— At the Coniagas, which has latterly taken a prominent place among shipping mines, 1,450 ft. of driving and cross-cutting has been done at the 75-ft. level. The concentrator building is about completed. When in operation it will handle all ore of a grade below 300 oz. per ton.—— Ninety men are

engaged on the Colonial mine working on the shore of Cross lake. A shaft is down 100 ft., and 40 ft. of driving has been done under the lake. Three adits have been driven into the hillside for several hundred feet.—— At the Nova Scotia 95 ft. of driving has been done at the 60-ft. level, and 240 ft. at the depth of 100 ft. in the main shaft, and 195 ft. on shaft No. 3.

Salt Lake, Utah.

Park City Consolidation.— News From Tintic.— Ore Shipments.— Another Transfer of Property.— Freight Rates.— New Mills.

Articles of incorporation of the Silver King Coalition Mines Co., capitalized for 1,250,000 shares of $5 par value, have been filed. David Keith is president; Thomas Kearns, vice-president and general manager; W. S. McCornick, treasurer. This organization is a result of the consolidation of the Silver King, Keith-Kearns, Magnolia-St. Louis, Pinyon Ridge, Odin, Belmont, and other Park City mining companies, involving all told about 2,000 acres of ground. The mill of the Keith-Kearns company will be dismantled and moved to the site of the Silver King plant to increase the capacity of the latter about one-third. It has been officially stated that a dividend will be paid by the new company in July. The consummation of this deal is considered to be one of the most important mining transactions of the year.——At the annual meeting of the Daly-Judge Mining Co., held at Jersey City, N. J., H. Otto Hanke was elected president, succeeding John J. Daly, retired; Moylan C. Fox, of Salt Lake, is vice-president; and G. W. Lamborne, of Salt Lake, secretary and treasurer. Frederick P. Burrell, who, in late years, has been in charge of California and Mexican mines, has been appointed mine-manager.

The Beck Tunnel Consolidated Mining Co., operating in the Tintic district, is sinking a new double-compartment shaft, which will enable the more economic handling of ore in the future. A possible reduction in the June dividend has caused a drop in the stock; however, the mine is said to be looking well.——The Colorado mine, at Tintic, paid a dividend after only a few months' energetic development work. An orebody of large size has been opened up. A new shaft is being sunk within 250 ft. of the Beck Tunnel side-lines.

Ore shipments from Tintic last week amounted to 142 carloads, the contributing mines and respective amounts being: Ajax, 5; Beck Tunnel, 6; Bullion-Beck, 6; Carisa, 4; Centennial Eureka, 54; Colorado, 8; Dupue, 4; Eureka Hill, 1; Godiva, 2; Grand Central, 9; Lower Mammoth, 6; Mammoth, 2; May Day, 2; Undine, 1; Legion Valley, 4; Scranton, 6; Shoebridge, 1; Tintic Iron, 7; Uncle Sam, 4; United Sunbeam, 1; Victoria, 3; Yankee Con., 4 carloads.——The final steps in the change of ownership of two Tintic properties, the Sioux Con. Mining Co., and the Utah Con. M. & M. Co., are now being taken. These companies were formerly controlled by Utah people, but later passed to Franklin Farrel and associates of Anasonia, Conn., back in the '80s, who operated the properties for a time, but finally closed them down in 1900. Recent developments in mines adjoining, particularly in the Beck Tunnel and Colorado, has resulted in the consummation of a deal whereby Mr. Farrel and associates are to turn the Sioux and Utah properties back to a Utah syndicate, with which Reed Smoot and Thomas R. Cutler are the leading spirits. At a special meeting of shareholders, the capital stock of the Sioux company has been increased to 1,000,000 shares, of $1 each.——The Tintic Mine Owners' Association has again taken up the matter of freight rates with the railroads and an effort is being made to induce the latter to reduce the tariff on certain grades of ore shipped to the Salt Lake valley smelters. The rates now in force are: $1.25 per ton for ore valued at $15 and under; $2.25 per ton for ore valued above $15 and under $25 per ton, based on the gross valuation. The mine owners want the gross valuation to serve as the basis in the future.

Chihuahua, Mexico.

Parral's Production.—New Concentrating Plant.—La Perla Group.— El Rayo Co.—Real de las Nogales.—New Street Railway.— Santa Barbara District.—Transfers and Sales.

The approximate production of the Parral camp for April was 20,970 tons, disposed of as follows: Shipped to smelters, 9,160; locally treated, 11,810 tons. The ground is being broken for the 100-ton custom concentrating plant to be erected by the Parral Reduction Co.; this is to be built about one mile west of Maturaña, the first station out of Parral on the Mexican Central railroad, about four miles east from Parral. At present a well is being sunk to supply water to the mill, and the grading and excavation for the plant is being hurried. A. P. Diescher, the engineer in charge, states that the concentrating plant will consist of one Blake crusher, three sets of Power & Mining Machinery Co.'s 16 by 36-in. rolls, two sets of double-three Hartz jigs, three sets of double-four Hartz jigs, cone-classifiers, Callow tanks, and four Wilfley tables. A complete steam-plant has been purchased consisting of a 300-h.p. Wisconsin compound Corliss engine, and Scotch marine boilers. Seven cars of machinery are now being held at El Paso until a switch can be secured from the railroad company. It is the intention to connect the mines in the immediate district with this reduction plant by means of a narrow-gauge railway. The stockholders of the Parral Reduction Co. are also largely in the Pittsburgh & Parral Smelting & Refining Co., the Providence Mining Co., the Big Four Mining Co., and the Garrison Townsite Co., operating in the immediate district. Five directors of the Parral Reduction Co. are: A. R. Hunt, general manager of the Carnegie Steel Works at Homestead; James Scott, general manager of blast-furnaces for the same works; H. O. Williams, general manager of the Carnegie Steel Works at Duquesne; F. B. Nimick, general manager of the Colonial Steel Co.; H. W. Brackenridge, capitalist.

La Perla group of properties has been attracting attention. These are situated in the Parral district, about six miles north of the City. The group covers 33 acres, and includes three veins, which run north and south, called La Perla, Diamante, and Danubio. On La Perla there are two new shafts 30 metres deep. A cross-cut, which has not yet reached either wall, shows the vein to be over five metres wide. Mr. Garcia, the owner, states that the ore extracted from the development work has more than paid for itself. The Perla vein is similar to the Veta Colorada of this district, in many respects, and has the same strike. It carries a silicious silver ore. On account of the good showing, all the ground surrounding these properties has been lately denounced.

El Rayo Mining & Development Co. will acquire all properties owned by Wm. V. Pettit near Azules, in the Santa Barbara district, including the Mary mine, held by Long Brothers, under option to Mr. Pettit. It will be remembered that last August, Geo. A. Schroter took Mr. Pettit's properties under option for the Venture Corperation of London. The result of exploratory work proved favorable, and led to the final sale of the properties to the El Rayo Co. In August an adit was started to cut the vein in depth. Later, in October, under the management of G. F. Hutchins, work was hastened with machine-drills. To date there has been 1,800 ft. of cross-

cut done. Four different veins have been struck, and these have added enormously to the ore reserves. The last and most important strike was made in May, and consists of a large body of one-ounce free-milling gold ore. El Rayo Co. expects to connect this adit with its lower workings in a couple of months. Developments during the next year will yield large returns, making this one of the big milling propositions in Mexico.——At Real de las Nogales, situated 60 miles northwest of Parral, and near Pilar de Conchos, a new camp has sprung into existence during the last few months. Nearly fifty years ago that particular locality gave good promise, and a small smelter was erected, which enabled the owners to produce about an *arroba* of silver per day. Before this work was well started the owner died, and from that time no attention was paid to mining. Lately, however, H. J. Repp and Dan E. Phelps have secured some promising ground, and as their prospecting has shown a good body of ore, extensive work is now being planned. The Zaragoza Mines Co., with J. C. Elwell as president, Francisco Chavez as secretary and treasurer, and D. E. Phelps as general manager, is about ready to erect a new smelter to treat the ore on the ground. On 59 *pertenencias* 14 shafts have been sunk, and all have shown ore.

R. J. Watson, of Tonopah, Nev., representing Pittsburg people, has recently closed for the Iberra No. 2, and the Vergara, in the Santa Eulalia district. The Iberra covers eight *pertenencias*, and was owned by Othon Sartorius. The Vergara is about the same size. The deal was made through Cruz Gonzales, of Chihuahua.—— It is reported that Pablo Olivas Prieto has obtained from the State of Chihuahua a concession for a railroad from Jimenez to Allende, both towns in this State; also that the State Government has granted a concession to Jose Maria Botello, of Parral, for the building of a railroad from Parral to San Jose del Sitio, a distance of from 60 to 70 miles.

L. M. Terry, of Chihuahua, and some New York capitalists have recently acquired the Inglaterra and Emma mines of the Chihuahua Investment Co. in the Santa Eulalia, on a working bond. These two properties are situated near the Democracia. The Inglaterra consists of 38 *pertenencias*, and the Emma of 21, or a total of 142 acres.—— The contract for the electric power for the new street railway in Parral, has been awarded to the Parral Electric & Water Co. The rails for the road are on the way, and ground is to be broken on June 1, and the line is to be in operation by December. As soon as the tracks are down, and the sewer and water connections made, the work of paving the principal streets has been promised.——The San Isidro ranch, near Jimenez, owned by Guy Flemming and associates, has been sold to Don Louis Terrazas. The San Isidro is said to be a valuable property, and a high price was paid for it.

The Parral Reduction mill, now under lease to the Parral Power & Reduction Co., has recently changed from steam to electric power, which is furnished from the power-plant of that company. The capacity of the mill has also been increased by the addition of rolls made by the Denver Engineering Works Co.—— The San Cristobal Mining Co. has installed an underground electric hoist. Power is being furnished by the Parral Power & Reduction Co.—— G. H. Keeler is the new manager of the Las Coloradas Mining Co. at Allende, taking the place of J. J. Coggins, whose death occurred recently at El Paso. Mr. Keeler comes from Atlanta, Ga., and will take charge at once.—— The Maria mine, owned by Louis Phelan, and situated in the Roncesvalles district, has been purchased by Parral capitalists, said to be A. Gallardo, J. M. Botello, Pedro Alvarado, F. Ortiz, and Armand Ricaud.—— Albert J. Anderson, chief engineer of the Minas Veta Grande y Anexas, is the new superintendent of the Jibosa and Veta Grande properties of the American Smelters Securities Co. in the Parral district. E. Percy Smith, the former superintendent, has been transferred to the Dolores at San Luis Potosi.—— Recent importations of machinery into the Santa Barbara district, and the milling improvements there are bringing that camp much in evidence. The production is greater than at any time for several years.

Butte, Montana.

The Washoe Smelter.—Its Big Capacity.—The Great Falls Smelter.—Shaft on the Tramway.—Butte-Milwaukee Meeting.—New Copper District.

In one day last month the Washoe smelter at Anaconda treated 10,600 tons of ore, the greatest amount that ever passed through the plant in 24 hours. The average for the month was 9,700 tons, of which 8,100 tons were concentrating ore and 1,800 tons first class. The smelter consumed an average of 16,000 tons of material daily, including ore, coke, limestone, and coal. During the first two weeks of May the smelter was producing 300 tons of copper daily. It is stated that the cost of treatment is equivalent to only 0.65% copper. The old smelter used to lose 1.5% of the assay-value, although before the plant was torn down the loss had been reduced to 0.69%. All the tailing and accumulations of dust, covering a large area about the smelter and stack, and even some of the slag at the old plant has been treated since the price of copper reached 20c. per lb., and good profits have been made out of it. Ten per cent of all the copper turned out by the new smelter is made from the slime, which went to waste at the old plant. As an example of the economy at the Washoe plant, it may be mentioned that the coal ashes are washed and the coal saved thereby nets the company about $400 per day. The other smelter of the Amalgamated Co., situated at Great Falls, produces not quite half as much as the Washoe smelter. The monthly output of the Great Falls smelter is nearly 8,000,000 lb. The April output of the Washoe smelter was in excess of 17,000,000 lb. copper. Both the Washoe and Great Falls smelters are being pushed to their utmost capacity, and the Great Falls plant is being enlarged so that next year it will be able to treat about 1,500 tons per day more than now. The capacity of the Washoe smelter is also, in various departments, being gradually increased. Of course, the copper production is

Montana.

not keeping pace with the output of ore from the mines, because it is the policy of the Amalgamated Co. to treat as low a grade of ore as possible while the price of copper is high; should the price drop, a much higher grade of ore would be mined, in order that the earnings of the various companies might not be reduced.

The shaft being sunk on the Tramway by the Butte Coalition Co. and the Butte & Boston Co., joint owners of the mine, has reached a depth of 1,000 ft., and the new engine, which was ordered last year, is arriving in sections and will soon be in position. The engine will be a duplicate of the one at the Pennsylvania mine and one of the largest in the Butte district. It will be capable of working to a depth of 3,500 ft. The foundation for it has been finished for several months. The Butte & Boston owns two-thirds of the Tramway and the Butte Coalition one-third. The new shaft was sunk as two compartments only, but the third compartment is being raised from the 1,000-ft level. The Boston & Montana Co. has workings under the site of the shaft and is making a connection from the 1,300-ft. level of its workings; the same company is also driving a cross-cut from the Leonard mine, at 1,400 ft. deep, to a point directly beneath the Tramway shaft and will raise to connect with the latter. The opening of the Tramway to a depth of 1,400 ft. will give both the Coalition and Butte & Boston a large supply of ore in the Tramway and Snohomish mines. During the early period of the litigation between the Amalgamated companies and F. A. Heinze, the Snohomish and Tramway were mined by a receiver and a large quantity of good ore was shipped.

A meeting of the stockholders of the Butte-Milwaukee Copper Co. has been called for June 14 in Butte, at which time a board of directors will be elected, and it is announced that the officers of the company will render a detailed statement. The Butte-Milwaukee was organized a little more than a year ago, and its holdings at present are some valuable claims in north Butte, and at Argenta, in Beaverhead county. In the Butte district it owns the Pollock, Colonel Sellers, Bird, and Florence. The company suspended its work on the Pollard, but lessees are working the upper levels. The Pollock shaft is 350 ft. deep, but it is a small two-compartment affair, and it was decided to sink a new shaft on the Colonel Sellers, which is more favorably situated for development of all the company's property. The new shaft is nearly 300 ft. deep, and is a standard three-compartment. The surface equipment is complete and the shaft will be taken to a depth of 1,000 ft. at least.

A new copper find has been made in an old gold district about 11 miles southwest of Butte, and mining men consider prospects good. The district has for years been prospected for gold, but has never been of any importance. Recently Charles Andrieux, a Butte stenographer, and several associates, resumed prospecting on several claims they have owned for years. It was decided to sink a new shaft, and within three feet of the surface they cut a copper-bearing vein, assaying 8%. The seam of ore widened with every foot of depth, and from a few inches it widened to more than a foot in a distance of 10 ft., and the assays increased to 34%. The news of the strike soon reached Butte and within a few days hundreds of prospectors were in the district and the country for several miles was covered with locations. The strike was made on a claim called the Lily Extension, and the outcrop of its vein can be traced for several miles. For several days all the automobiles and vehicles in Butte were engaged by men going to the new district. Sinking on the Lily Extension will be pushed with all possible speed to ascertain whether the copper deposit continues below the water-level.

Denver, Colorado.

Zinc Industry in the San Juan.—The Silver Lake Mill.—The Cripple Creek Adit.—Equipment and Plans.—Copper in Routt County.

With the increase of the importance of the zinc industry of Colorado comes the announcement that the San Juan district is to have a zinc smelter. A plant capable of treating 150 tons per day is to be erected at Rico. The nearest plants at present are at Pueblo and Canyon City, and some of the ores have been sent abroad for treatment. The price of spelter is now above that of lead, and with the stimulus of high prices, and the advantage of a local market for ore, zinc mining in the San Juan region should advance rapidly. The concentrating plant of the United Rico Mines Co. has begun operations and expects to be running at full capacity in the near future. The plant is treating the dump of the Group tunnel and the concentrate is being shipped to Durango.

As an example of rapid construction under adverse conditions the Silver Lake mill at Silverton commands attention. Just a year ago it was burned to the ground. Shortly afterward the reconstruction was started, and the mill was completed within eight months, most of which was in winter. The plant is now undergoing its trial run, and will soon be in full operation.——The bids for the driving of the drainage adit at Cripple Creek have been opened and the lowest proves to be between $20 and $21 per foot. If this bid is accepted, it will make the total cost of the completed adit considerably over $500,000. The signal importance of this deep drainage adit is derived from the fact that it will tap the main watercourse 740 ft. below the present deepest drainage, opening reserves of ore that cannot now be reached. Its portal is in Cripple Creek cañon, about six miles south of the town, and at an elevation of 8,020 ft. From there it will be driven in a northerly direction 14,500 ft. to the workings of the El Paso mine, and, probably, thence easterly 11,000 ft. to the workings of the Vindicator. The funds for the work have been contributed by all the principal companies operating in the district. A shaft is likely to be sunk about 10,000 ft. from the portal, and the heading advanced both ways from this, which, with an average advance of ten feet per day in each heading, will permit the reaching of the El Paso workings in two years. At the portal is installed a Norwalk 12-drill compressor, belt-driven from a 400-volt, 175-h.p. induction motor. Three 50-k.w. Westinghouse step-down transformers take the power from the three-phase, 60 cycle, 6,600 volt, transmission line and deliver it to the motor, lighting-plant, and sawmill. The power is drawn from the transmission line from Canyon City, which transmits at 20,000 volts to Fairview. Ingersoll-Rand 3½-in. drills are used for driving. A most serious problem in the driving of the adit will be the disposal of the waste from the adit, as the cañon is extremely narrow at this point. If it were possible to drive headings from the workings of the El Paso a much greater rate of advance could be gained, but that is impossible, as the workings are now full of water to the 400-ft. level. The smelter at Golden, near Denver, has recently been sold, and, as usual, it is stated that "the Guggenheims" have acquired it.——The Six-Day and Perigo groups of mines in northern Gilpin county have been consolidated under one ownership. The mill belonging to the consolidation is to be re-modeled, and an electric-power plant is to be built at Pactolus.——Large claims are made as to the value of the copper deposits recently discovered in the extreme south-eastern corner of Routt county. It is scarcely to be expected that the real worth will prove as great as that claimed, but it may prove the beginning of the mineral development of that part of Colorado.

Concentrates.

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

TWO KINDS of dry-crushers are used in the Kalgoorlie district, ball-mills, and Griffin mills. For wet grinding, flint mills and Huntington mills are employed.

THE coefficient of expansion of concrete of the proportions 1:2:4, is 0.0000055 for one degree F., and is almost the same as that of untempered steel, which is 0.0000060.

CONCRETE FLOORS are not well adapted for use around electrolytic or lixiviating plants, because acid solutions attack and gradually disintegrate the cement. However, asphalt coatings will largely prevent this action.

THE sand-wheel is in general use on the Rand, there being a number that are 60 ft. in diameter, capable of raising the tailing from 200 stamps. The first cost is large, but it is reliable and durable and requires a small expenditure for maintenance.

THERE are two principal types of mechanical conveyors, those of the push or drag type, and those of the carrying type. In the former the material is moved forward in a trough, while in the latter it is continuously carried forward on a belt or in pans or buckets.

THE power required to operate a belt elevator is comparatively insignificant. The apparatus itself is in equilibrium, and only such power has to be applied as is necessary to lift the ore and overcome the friction. One horse-power would be ample for lifting 10 tons per hour to a height of 40 feet.

MANY millmen have come to the conclusion that outside amalgamation has proved itself as good as, if not better than, any other method, and it is the method which reduces losses and risks to the minimum. The millman is working more or less in the dark, when employing inside amalgamation.

CORRUGATED SHEET-IRON is one of the cheapest and most useful materials for buildings for metallurgical purposes, particularly for roofs. The corrugations give linear rigidity to light sheets, and render them strong and self-supporting, requiring a comparatively inexpensive framing of steel or timber.

THE sloping belt elevator has an advantage over a perpendicular one, in that it is self tightening. A vertical elevator should have an adjustable foot wheel, to arrange for a proper tension. The head wheel should be over 30 in. diameter, but the diameter of the foot wheel is not of so much importance, except that it should not be so small as to injure the belt.

THE steel-hardening metals are nickel, chromium, manganese, tungsten, molybdenum, vanadium, titanium, cobalt, and uranium, named in the order of the importance of their production and use for steel-hardening purposes. Manganese is produced in large quantities for use in the purification of steel. The minerals from which these metals are obtained are as follows: Smaltite, chromite, wolframite, hubnerite, scheelite, molydenite, wulfenite, rutile, carnotite, and uraninite.

THE opinion was formerly held that the grinding in a tube-mill was done by the balls rolling on the slope of the drum, inside the whirling mass, the ore being crushed between the balls. Experiments have proved that this explanation is wrong and that the tube-mill does not appreciably grind the ore either on the slope or in the interior of the whirling mass, but crushes it by an inclined beating action, and that the higher position of the feed, as compared with the discharge, is of no importance for conveying the material.

THE term phosphate rock as used is applied to several forms of amorphous deposits, consisting to a greater or less degree of phosphate of lime, $3CaO, P_2O_5$. The commercial deposits always carry variable quantities of carbonate of lime and other substances. Trade names have been applied to the several kinds of phosphate rock which are exploited commercially. They are as follows: Hard rock, soft rock, land pebble, river pebble, land rock, river rock, black or blue rock, brown rock, and white rock.

THE only well-attested diamond discoveries in the drift region of the United States during the last four years have been those in connection with the gold washings of Brown and Morgan counties, in southern central Indiana. A full series of specimens of the rocks and minerals found in the gold-bearing drift of this region has been obtained for the purpose of having them compared with the rocks in Canada, north of the Great Lakes, with a view to tracing out, if possible, the source from whence the diamonds came.

COMMON SALT occurs in nature as rock salt, or in solution as brine, varying in strength from that of the ocean, 2.68% by weight, to that of the Great Salt Lake, 18 to 20%, and of the Dead Sea, 22 to 24%, and as sundry subterranean brines of different strengths. Natural salt is almost always somewhat impure, through the presence of small quantities of one or more of the chlorides, sulphates, and carbonates of potassium, calcium, and magnesium. The rock salt of the Holston Valley, Virginia, has been shown to contain 99.55% NaCl; that of Petite Anse, Louisiana, 98.88 per cent.

THERE are four regions where diamonds have been discovered in the United States. These are: The Pacific Coast, chiefly along the western base of the Sierra Nevada, in the central counties of California, associated with gold in the cement gravels; along the line of the moraine of the ancient ice-sheet in Wisconsin, Michigan, Indiana, and Ohio; these have been transported from an undiscovered source, presumably somewhere in Canada, Kentucky, and Tennessee; the Atlantic States from Virginia to Alabama, chiefly along the eastern base of the Appalachians in what is known as the Piedmont region. The actual place of origin of the diamonds is in all these cases unknown.

THE hydrocarbons occur in nature in many forms, and in all conditions, from viscous to solid. One kind or another is found in or associated with the rocks of every geological age, from the Lower Silurian to the Pleistocene. Asphaltic deposits usually are found as impregnated beds intercalated among strata of sedimentary origin, or as limestone containing fossils, or cavities filled with bituminous matter. As a result of local conditions the harder hydrocarbons, like albertite, gilsonite, wurtzilite, and grahamite, are found filling vertical fissures, but ordinarily the asphalt-bearing bed is capped by a bed which has proved impervious to the liquid, which has originated probably, in part, at least, in some lower stratum, and has merely concentrated in the position where now found.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy.

The Beaches of Nome.

The Editor:

Sir—If you will look at the issue of this journal, under date of February 28, 1903, you will find a short sketch describing the tundra at Nome. Since then the development of the tundra has been steadily going ahead as outlined in that article, although even the most optimistic resident of Nome did not anticipate that the gold-bearing beaches would prove as numerous and as rich as they have been found.

It appears that the immediate vicinity of Nome has undergone a gradual uplift, varied at one period by a sudden depression, and that these different changes have left the beaches either much higher or lower than the present beach, as the case may be, while the Bering Sea has been steadily receding on account of the debris washed down from the hills.

Already seven beaches have been traced. The first beach found was the present level stretch, which caused the big rush to Nome in the year 1900. The second was found about 3,000 ft. back of the present beach on the tundra, in the year 1903, at a depth varying from 20 to 40 ft. at a uniform level of 37 ft. above the present sea-level on a blue clay bedrock. Very good pay has been found, some claims yielding as much as $50,000. The third was found in the year 1906, close to the foothills, about three miles from the present beach; this one is at a uniform level of 72 ft. above the present level and rests on the hard mica schist bedrock. The depth to the pay-streak is very uneven, in some places a stratum of 120 ft. of clay has to be penetrated before the pay is found. The pay is in sand, exactly similar to the present beach and the gold deposit is at the very edge of the beach, from 30 to 80 ft. wide and from 1 to 3 ft. deep. It is this deposit that has produced millions of dollars and will continue to produce millions for several years to come. The streak has been traced for several miles and the discovery of it last February, on Irene creek, east of Nome river, opens a new area of it for about ten additional miles.

The pay-streak, of course, is spotted, in places rich and in others less so, but the average is most satisfactory. The Portland bench has produced at least $1,500,000, the discovery on Little creek had a streak of pay on bedrock of almost pure gold, the Bessie bench will produce at least $1,000,000, the Halla tract and the Diamond L claims about $500,000, the Bear Cub, the Duplex, the Roosevelt, and the Golden Bull are also claims that will be big producers of gold during the season.

The fourth beach is the one called the Intermediate, which is situated half-way between the third and second beaches; it is at a uniform level of 22 ft. above the present sea and is also called the Clam Shell line, for the reason that the pay is found among petrified clam and oyster shells. The fifth line is between the Intermediate and the third beach and is termed the Flat creek line; it carries coarse gold. The sixth line is situated between the Intermediate and the Flat creek line but not enough prospecting has been done to demonstrate the value of it. The seventh is situated above the third line and is still closer to the foothills, the extent of it is not known. The beaches have been traced rapidly during the past year on account of the same elevation on each line. By taking the levels it is possible to tell with mathematical accuracy how deep one has to sink the shaft to find pay.

However, the bedrock level changes beyond Little creek westward, for land-slides have taken place, which have altered the levels in that vicinity; for that reason the beach-streak has not yet been picked up beyond Little creek, but it is bound to be found and must be immensely rich, because the hinterland has some creeks that have produced big money.

In the Solomon district the beach-lines appear to be on different levels; the uplift must have been higher. Some good indications are being found on Jerome creek and before the summer season arrives there is no doubt that several miles of gold-bearing gravel will be discovered in that direction.

If the output of the mines had not been reduced on account of the labor strike, this would have been the best winter season Nome has ever had, as far as the output of gold is concerned, at any rate, the gold production this year from the Nome region should reach about $10,000,000, as compared to $7,000,000 last year.

It will be several years hence before the gold output from Nome will decrease; for at least five years more the beaches alone should make Nome a prosperous and lively camp.

OTTO HALLA.

Nome, Alaska, March 4.

Powder in Blasting.

The Editor:

Sir—As every little helps, especially in mining, where there are often many different ways of doing the same thing, the following regarding the use of powder in blasting may be of some aid to mining men. Powder is an important item in the expense account of a mine and it is greatly misused and wasted. The careless handling of it is also in evidence. Lack of facilities or willful neglect in thawing frozen powder result in the ineffectiveness of much that is used. When frozen its breaking strength is in a great measure decreased and in this condition it is, likewise, more dangerous to handle. I have seen miners, so-called, break in two with their hands a stick of giant powder, frozen as hard as a rock. It can be safely thawed by placing it in tubes, themselves immersed in circulating, or still, water heated to the right temperature.

When employed for charging holes, there seems to be a marked tendency to use too much. Holes are often charged to the collar, especially when a miner has a 'short round' and thinks that by so doing he can make a better showing. I have repeatedly observed that a good miner, one who breaks the most rock, will charge his holes only about one half, and I have seen it proved that a hole thus loaded will 'break' as well and with much less gas thereby generated, as when loaded to the collar. These gases generated by the powder—after explosion—are rightly dreaded by miners, and consideration thereof is most important. Furthermore this generation of gases is precisely the result—and about the only one—obtained by ramming a hole full of powder, or, as is common, by tamping it with the powder. The general belief, underground, that tamping the hole will keep out air, thereby increasing the efficiency of the powder, is not entirely borne out in practice. Another matter, which seems to call for a difference of opinion, is priming a hole. Should the primer be put in first in the bottom, in the middle, or last, or where? It is immaterial, for it will explode the powder as well in the bottom as in the middle. It would appear possibly safer to put the primer in last, as it would not then be subjected to so much tamping, but with an inferior quality of fuse there might be less chance of a 'burnt hole,' if it were put in the bottom. In wet holes (to avoid mis-fire) it is best,

even after having well greased the primer, to put it in at the last.

As for tamping down the powder with an iron cleaning rod or a drill, that speaks for itself! But I have seen it done, and the excuse given for it was that so-and-so, a good (?) miner, did it. In brief, if a stick of powder be more than needed, it should be cut in two with a knife, not broken. While the use of too long a fuse is not to be especially censured, the excessive use of powder, besides being wasteful, is the cause of many a 'powder headache' and has even more serious consequences, due to the gases thus generated, particularly in a mine, or in different parts of a mine, where there is poor circulation of air. Powder, when frozen, should not be used; if there be no other means at hand of thawing it, sit on it for a bit.

A. L.

Oakland, California, May 9.

On Technical Writing.

The Editor:

Sir—Your article entitled 'On Technical Writing,' under date of March 23, has only just come to my notice, owing to my absence abroad, and as nearly 25 per cent of the selections from the Proceedings of the Institution of Mining & Metallurgy refer to me, I am under the painful necessity of having to enter the arena with you, and I hope to crush you under the avalanche of my just wrath.

Taking your criticisms as a whole, I think that they are given up too much to mere abuse and caustic sarcasm, which is not argument and proves nothing, except your own command of the English language, and suggests the probability that you were suffering from a bad liver when you wrote the article in question. If it is only a matter of liver, I can sympathize with you.

However, in extenuation of any faulty English which may be contained in the remarks, from which you give extracts, I would point out that you are quoting from verbal discussion, delivered at a meeting of the Institution, and I think it is patent from the text that such discussion was extempore; consequently, the subject matter is hardly appropriately discussed under your heading, 'On Technical Writing.' If you write a skit 'On Technical Talking' I may plead guilty to being within your jurisdiction.

You seem to be particularly wrought up regarding the use of the adverb 'very.' Personally, I think that most people do distinguish between things that are "more or less, very, or somewhat exceptional," and I will give an illustration to prove it. If a man came into a mining engineer's office and offered him a good fee to make an examination of a property, and the mining engineer refused the fee on the plea that the pay was too high, we should describe the case as *exceptional*, and if the mining engineer, not content with that, turned on his client and abused him, for voluntarily offering such big fees to professional men, and said it was idiotic to establish such a bad precedent, then, Mr. Editor, I should say the case was *very* exceptional, and likewise *very* peculiar.

You object to the use of the word 'proposition,' which you describe as a vulgarism. Your criticism is abuse and your argument not convincing. Your suggested synonyms are all less appropriate than the word you villify.

Wherein, Mr. Editor, is the mock modesty in the use of the indefinite pronoun 'one,' and wherein is the haziness in the expression you criticize. The sentence is grammatical, conveys clearly the meaning intended, and, as for the style, that is merely a matter of taste. The pronoun 'one' is an expression of *true* modesty on the part of *one* who cannot take refuge behind the high-sounding editorial 'WE.'

As far as technical writiug in general is concerned, my opinion is that mining engineers as a class start life with a poor education in the English language; then they spend a number of years in surroundings that tend to weaken their hold on the subject; and it is only when they attain positions of responsibility that they feel the need of a ready pen. But the attainment of fluency does not always bring with it a thorough grasp of the rules of grammar and orthography, and even among the small percentage of 'literary' engineers there remains a great deal to be desired in the direction of style, diction, and grammar. I do not think that your thunder will do any good, because the average engineer finds his life too much occupied in other directions to worry his head about whether what he writes would pass for its literary excellence. He is satisfied with saying what he has to say, in a manner that will be understood by his readers. I do think, however, that a great deal could be done by the editors of the publications of the technical societies. A number of faults you point out could be avoided by more careful editing, and no author would object to proper punctuation or the proper abbreviating and hyphenating of words.

C. S. HERZIG.

London, May 9.

How to Wild-Cat.

The Editor:

Sir—Get a claim near some mine, give it a name that can be mistaken for the adjacent property, leave a man there well supplied with telegraphic funds with instructions to use them prodigally; experience of mining is not necessary, provided he is prolific in mining lore, big imagination, and careless of telling the truth; form a company, get a lot of certificates printed, engage two or three brokers as fiscal agents and instruct them to go the gait; supply them with all the probable possibilities of your mine becoming a bonanza; in case of a lull in sales instruct your man at the front to make a strike, and in case he fails, discharge him for incompetency; in replacing him be sure to get a man incompetent as to mining, but well versed in geological gab; and just before your promised dividends are due let the control pass to someone else on whose shoulders you can shift the responsibility.

J. C. CLARK.

Goldfield, Nev., May 21.

Secondary Enrichment.

The Editor:

Sir—Your comment in the issue of May 11, referring to Mr. Hiram Hixon's suggestive contribution, brings out an important point, which seems to find substantial proof in the Cobalt ores, namely the *indirect* action of carbonaceous matter as a possible precipitating agent. Sections of ore from Cobalt sometimes show small grains of sulphides, with an incrustation of metallic silver. Is not this strong evidence that, although the carbon may have been indirectly responsible by precipitating iron sulphide from sulphate waters, the sulphides are the immediate precipitating agents of the precious metals?

D. F. C.

Redding, Cal., May 18.

IN winning the precious metals in Colorado, considerable quantities of argentiferous manganiferous iron ore are obtained, which does not carry a sufficient amount of gold and silver to make it valuable on that account, but because of its iron and manganese content is available as a flux in the smelters.

Tonopah, Nevada.

Written for the MINING AND SCIENTIFIC PRESS
By a Special Contributor.

Tonopah was discovered in the spring of 1900. It is now considered the metropolis of the desert. Substantially built, with water and power transmitted many miles, this settlement is now the centre of the highest engineering talent in Nevada. Its mines are well equipped and most of the undesirable characteristics of the mining camp are comparatively suppressed. Mills will soon be treating a tonnage that will give the camp a period of remarkable prosperity.

In April of 1900, James L. Butler left Belmont to prospect in the district south of the site of Tonopah near the old camp of Southern Klondyke. On Mispah hill, he noticed the outcrops of the Burro veins, and took samples. These, like so many of the rich outcrops of Nevada, showed little to attract attention and were overlooked for a time and then thrown away by the assayer. Returning to Belmont, Butler broke off more specimens, which he handed to T. L. Oddie, on the understanding that the latter was to get an interest in the find, if he got them assayed. Oddie was then a lawyer in charge of the Stokes mine at Austin. The samples proved surprisingly rich. Butler and Oddie hastened to the discovery. It was in August that the claims were located and two tons of sorted ore were shipped while the location work was being done. This was sold for $600 and from that time the mine has paid for its own development. During 1901, the mines were given over to lessees, who probably extracted about $4,000,000. In 1902 the Tonopah Mining Co. entered the field. At this time the desert was covered by the excited population of a new mining camp. In the centre of the town, rich ore was struck in a shaft sunk in an unmineralized volcanic rock. Prospectors and promoters quickly took advantage of the find. Claims far away from real discoveries were in demand. Shafts were sunk in many places. Some were the honest investment of earnest men, many were desperately forlorn hopes, and still more were common swindles.

Rich ore was found at considerable depth by sinking through the barren andesite near the known producing area, notably at the Montana Tonopah, Desert Queen, and Tonopah Extension shafts. The geological features soon became well understood and in 1903 the gambling element found another field; the period of reckless and feverish excitement was at an end.

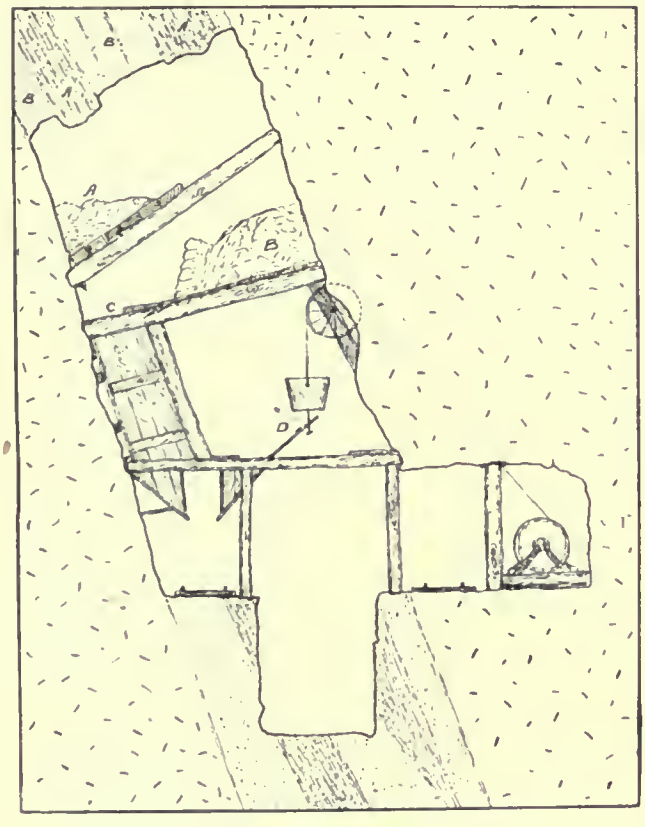
Tonopah has all the appearance of a mining town that depends upon the intrinsic value of its mines rather than living on the ephemeral prosperity resulting from wild speculation. The floating population, with all its unsavory attendants, has come and gone, and the mines are largely in the hands of companies that are exploiting them with the help of the best engineering talent. The town is situated in the foothills, the monotony of the desert being broken by the steep volcanic buttes. The camp is a pleasant contrast to the boisterous activity of Goldfield. Tonopah has assumed proportions commensurate with its industry, and is now settling down to work its mines with the utmost economy that the distressing conditions of the desert will allow.

The Tonopah of Nevada and the Montana Tonopah are the principal companies operating in the camp and they are now making every effort to overcome the trying conditions, and treat their low-grade ores on a large and economic scale. At the Montana Tonopah, high-grade ore has been shipped in sufficient quantities to pay the cost of development and the construction of the mill, which is now nearing completion. No attempt has been made to increase the production beyond this point, and the wisdom of this policy is self-evident. The cost of sorting, freight, and smelting last year was $19.30 per ton, whereas it is estimated that the ore will be milled at Tonopah for $3 per ton. The shipping ore averages $50 to $60 and is largely treated by the smelters in California, where it is used for fluxing the highly basic ores of Shasta county. For this purpose it is not altogether satisfactory. The quantity of fine made by the samplers and the high percentage of alumina are detrimental to blast-furnace work, the former necessitating screening and briquetting, while the latter thickens the slag and prevents an easy separation of low-grade matte. Careful mill-tests have been made and a mill is being erected near the shaft. Water will cost $1 per 1,000 gal. and electric power $8 per h.p. per month. A plant to crush in two stages is being erected at the shaft immediately below the steel ore-bins; this will consist of one No. 5 and two No. 3 gyratory Gates crushers, which will break the ore

Montana-Tonopah Mill in Course of Construction.

to ¾-in. ring. From here the ore will be elevated by a belt-conveyor to the mill-bins. The ore will be crushed in a 40-stamp mill to 12 mesh and it is expected that 150 to 200 tons will be treated per 24 hours. This product is to be classified, the coarse material passing to eight Wilfley tables, while the slime and fine, together with the tailing from the Wilfleys, go to two Dorr classifiers, which precede the tube-mills. The latter will grind the coarse product to 150 mesh. The re-ground material then forms the overflow from the Dorr machine and the whole product will pass to two large cone-classifiers. The underflow from these cones goes to 16 Frue vanners and the overflow joins the stream of tailing from the vanners and runs to the settling-vats in the cyanide plant.

From the settlers the pulp is taken, as required, to the agitators, of which there are six of the Hendryx type.



Method of Mining.

After agitation in a cyanide solution, the pulp is drawn off to a large reservoir, where it is stored for filtering by means of the Butters vacuum filter-press. The gold and silver-bearing solution recovered from the Butters filter will be precipitated on zinc-dust in the Merrill precipitation-press, which has been so successfully used at the Homestake mine.

The mine is at present being prepared for a large output of milling ore. For this purpose chutes are being put in at 20-ft. intervals in the principal orebodies and preparations are being made to handle the ore-dumps at low cost. These will be drawn down in raises put up from the adit-level to the bottom of the dumps. The ore will be loaded in cars from these chutes and hoisted through the main shaft. A complete equipment is now installed for a constant and large supply of ore. Ample ore reserves are blocked out with chutes and bunkers for economic handling. A double-deck cage will be used with a counterbalance; a complete reserve hoisting and compressor plant, driven by a steam engine, is in place. The equipment is a double-drum double-cylinder 15 by 18-in. hoist driven by compressed air. The compressor, which is a 12-drill Ingersoll-Sergeant, is driven by a 200-h.p. motor, the power being supplied by the Nevada Power & Milling Company.

The arrangements for sorting ore in the stopes is shown in the accompanying diagram, together with the method of sinking a winze. In the vein there occur bands of shipping ore *A*, alternating with material of milling grade, *B*. These are separated underground, the shipping ore being broken down on a platform, from which it is shoveled to the chutes. The milling ore, generally below $50 per ton, is held in the stopes, as indicated. At *D* is shown an automatic dumping device, by which the hoisting engineer can empty the ore into the chute. The necessity of working out this shipping ore and leaving large quantities of milling ore in the stopes has made economic mining an impossibility. In few places has the vein been completely stoped. Generally the walls are strong and the amount of timber required will not be excessive when the milling ore is removed in a systematic way. Timber and fuel supplies are quite inadequate to meet the demand. Fire-wood is now $35 per cord, lumber $50 to $60 per 1,000 ft. and coal $37 per ton, but the price is not as serious as the scarcity of material. Several of the mines have been shut down or crippled by the fuel situation. This is one of the most important problems to be solved. The lack of locomotives and shortage of supplies prevailing in the West is only accentuated in this district.

More serious, however, are the relations between capital and labor and the prevalent tendency to make indefinite compromises. The conditions are better at Tonopah than elsewhere in Nevada, but they are serious none the less. It will require the utmost diplomacy from the Governor of the State to the Dago mucker to avoid a situation as serious to the miners as to the operators themselves.

The Prospector.

Enquiries sent to this department are answered free of charge, if submitted by subscribers who are not in arrears. The full name and post-office address of the sender must be given, otherwise no answer will be made. Those who are not subscribers must accompany their questions with a fee of $3 for each question. No assays are made.

A fragment of Andesite was sent from Wallace, Idaho, by A.

The black mineral sent by A. C. W., of Randsburg, Cal., is Hornblende.

A Rhyolite Pumice stained with Iron was sent by T. R. from Los Angeles.

C. S. V., of Daggett, Cal., sends: No. 1, Dacite; No. 2, Andesite; No. 3, Andesite.

We named the rock sent by O. H., of Bodfish, several weeks ago. It is a ferruginous sillimanite Schist.

The specimens from F. G. C., Silver City, New Mexico, are: No. 1, Sandstone; No. 2, Specularite, Quartz, and Limonite.

The specimen of Clay sent by C., of Chittenden, Cal., carries considerable sand and is not a high-grade clay. It might do for brick.

The specimens sent from Casa Grande, Ariz., by W. J. F., are: No. 1, Andesite; No. 2, Andesite; No. 3, Andesite; No. 4, Pectolite and Garnet.

B. G. sends from Ydalpom, Cal.: No. 1, Andesite; No. 2, Andesite Tuff; No. 3, Andesite; No. 4, Rhyolite Tuff carrying Pyrite; No. 5, Andesite; No. 6, Andesite; No. 7, Andesite carrying stringers of Quartz.

Phosphate Deposits in the West.

By F. B. WEEKS and W. F. FERRIER.

*Within the last few years it has been found that the Upper Carboniferous rocks of the central Cordilleran region include a series of oolitic beds containing phosphates. These beds are known to occur over a considerable area in southeastern Idaho, southwestern Wyoming, and northeastern Utah. Prospecting has been carried on at a number of widely separated localities.

In Idaho the beds outcrop along the Preuss range, extending from the line of Bannock and Bear Lake counties in a southeasterly direction along its west face. A probable southern extension of these beds near the Idaho-Utah line is found on the mountain slopes east of Bear lake, where the overlap of upper Mesozoic sediments has been eroded. East of the Preuss range, in the Sublette range in Wyoming, are similar beds which follow the southerly trend of this range to Smiths Fork.

The mountains rise 1,500 to 3,000 ft. above the intervening valleys and the region is drained by Bear river and its tributaries. The Oregon Short Line railroad follows the valley of Bear river and affords the only means of transportation to market. At present only those beds that lie nearest the railroad shipping points are being worked. In Utah the phosphate series has been found south of Bear lake, in the vicinity of Woodruff. The beds also outcrop in Weber cañon, about 1½ miles below Croydon, and in some of the side cañons. None of these beds are being worked at present. The Union Pacific railroad, which follows the course of Weber river, will make possible a rapid development in this region.

Beds of good grade, but too thin to be profitably worked, have been observed at other points in these States and also in Nevada. It is highly probable that further exploration will show that these oolitic phosphate beds have a still wider distribution.

Many substances have been mistaken for the phosphate, notably some of the fine-grained, loosely bedded, dark-gray ash rocks commonly associated with the lavas of southeastern Idaho and other places. These ash rocks are as a rule much lighter in weight than the phosphate.

The accompanying map shows the areas of Upper Carboniferous rocks, of which the phosphate series forms a part, and of the overlying and underlying strata of this region; also the position of the deposits of economic value.

As the phosphate series occurs within the Carboniferous rocks, a more detailed description of these strata will be given. They outcrop in eastern, central, western, and northern Utah, southeastern Idaho, and adjoining portions of Wyoming, and in northern Nevada. Their lithologic characters are persistent, and the three subdivisions may be recognized in the above-defined area.

The limestones that form the lower division are generally massive and occur in bold and precipitous outcrops. In many places they are coarse grained and weather rough and in dark colors. They are also rather silicious and contain some cherty layers and masses. This division is 2,000 ft. thick. At the top of the limestones the beds become sandy and the quartzite series generally begins with an alternation of sandy limestone and sandstone, and continues through several hundred feet of sandstone weathering red and yellow. These are succeeded by yellow, white, and gray sandstones and quartzites, the upper half of the series being quartzite, readily recognizable as such. This quartzite in most places grades into a dark, rather coarse granular limestone—the Upper Coal Measures limestone of the Fortieth Parallel Survey. The upper part of this formation consists of yellow sandstone and sandy limestones, which grade into a blue-gray compact limestone just beneath the phosphate beds. In these blue and gray limestones indistinct fossils weather out on the surface, but are difficult of determination. This portion of the section varies considerably in the character of sediments.

The phosphate series consists of alternating layers of black or brown phosphatic material, shale, and hard blue or gray compact limestone. The limestone is in the main fossiliferous, containing well-preserved forms of *Rhynchonella*, *Chonetes*, *Omphalotrochus*, and *Productus*. The shale contains *Lingula* and lamellibranchs. The series is in places about 90 ft. thick. The beds vary in thickness from a few inches to about 10 ft., but where of extreme width they are broken by thin layers of shaly material poorer in phosphates. At the base the series begins with limestone, and as a rule 6 to 8 in. of soft brown shale overlies this basal limestone. Above is the main phosphate bed, 5 to 6 ft. thick. This is almost entirely oolitic in structure and high in phosphates. Several other beds, varying in thickness from a few inches to about 10 ft., separated by 6 to 24 in. of limestone or shale, occur in the series. The beds of extreme thickness, as already mentioned, contain seams of shaly material, itself phosphatic, too thin to be separated from the pure oolitic material in mining. All the sections that have been examined show one, and some of them two, beds of commercial value.

The beds rich in phosphates are overlain by a coarse-grained, locally brecciated limestone, for the most part in massive outcrops. Above this limestone is sometimes found 100 ft. of nearly white limestone, but as a rule it is succeeded by the series of blue and gray limestones containing large spirifers and *Productus*. Next above is a series of red sandstone and shale containing brachiopods and lamellibranchs. Still higher in the section is a considerable thickness of blue, gray, and greenish limestones, which form the upper part of the Upper Carboniferous series, and in the Montpelier region there are silicious limestones and red sandstones containing *Ammonites* and other fossils of Lower Triassic age.

The succession of strata in the range east of Montpelier, Idaho, is, in places, broken by folding and faulting and where this is the case the structure is difficult to follow, since not only does the faulting vary in amount of displacement, but the beds, particularly on the west side of the fold, contain numerous rolls, which cause both the strike and dip to vary within short distances. The intense compression to which these beds have been subjected has produced a remarkable fracturing by which they appear to be on edge, with a general north-south strike. The dip, however, is to the west at angles of 20 to 30 degrees.

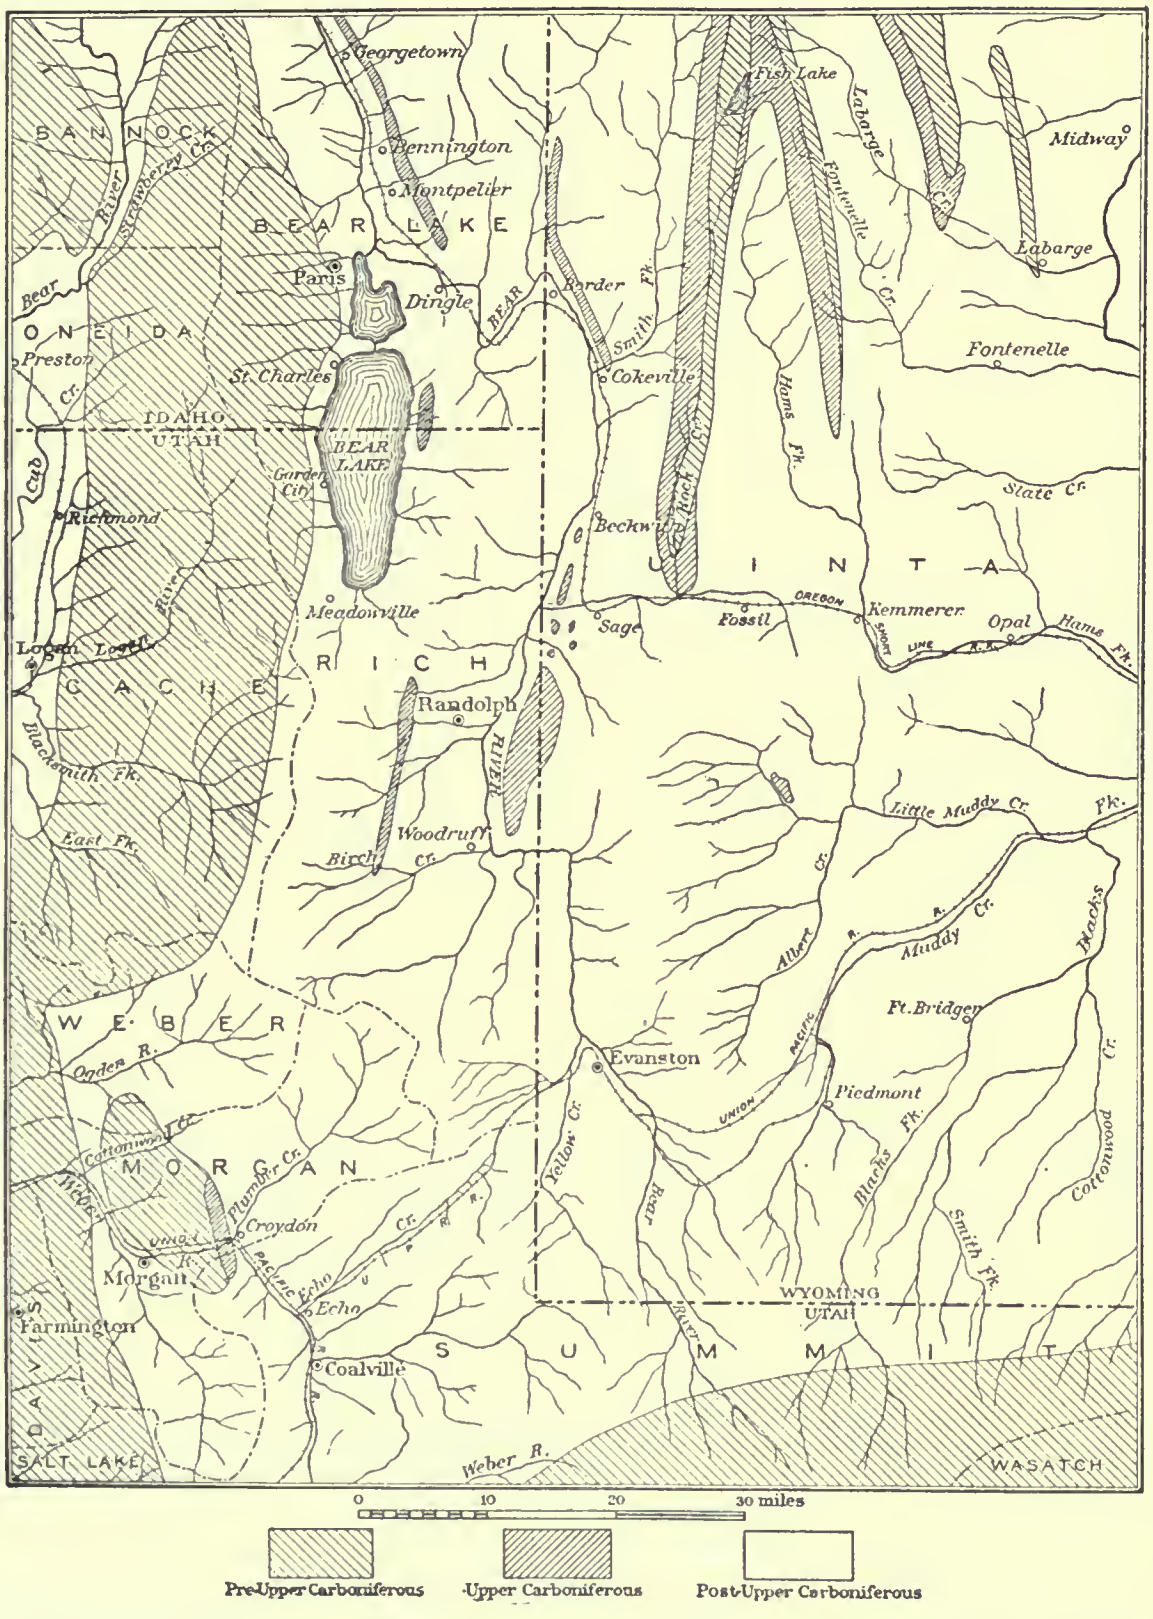
In the cañon of Montpelier creek the lowest beds exposed are yellow sandy limestone and sandstone and blue-gray silicious limestone, which immediately underlie the phosphate series. The overlying limestones generally occur in massive outcrops. A prominent spur of the range extends nearly to the town of Montpelier and is formed of limestones and sandstones of Upper Carboniferous and Mesozoic age. The lower portion of the Upper Carboniferous series, including the phosphate beds, is exposed on the north side of Montpelier creek. On the south side of the creek the phosphate series is buried beneath the detrital slopes, and the outcrops of the phosphate beds are exposed only in the numerous draws that cut across the strike along the range. Between these points the beds are not visible except where exposed by development work, particularly on the Waterloo placer-mining claim. Their presence, however, is indicated by pieces of float and the characteristic darkening of the

*Abstract from 'Contributions to Economic Geology,' 1906, Part I. United States Geological Survey.

soil overlying them. Here the beds dip to the west at a low angle—about 20 to 30°. They are remarkably uniform in character over a wide area, rolling slightly, but showing no signs of serious disturbance. Erosion has removed the upper beds from a large portion of the ground, leaving areas in which the main phosphate bed is now covered by only two feet of limestone and a few feet of shale and surface detritus. Here and there the top of the phosphate bed itself forms the surface of the ground and in places the bed has been completely eroded, leaving only the hard underlying cherty limestone. The band of limestone already referred to, which immediately overlies the main phosphate bed, is locally shattered in a remarkable manner without displacement, the phosphate bed beneath being but little affected and both limestone and phosphate retaining their usual dip.

From a practical standpoint the limestone immediately overlying the main phosphate bed at Montpelier is of

U. S. GEOLOGICAL SURVEY BULLETIN NO. 315 PL. IV



MAPS OF PARTS OF IDAHO, WYOMING, AND UTAH, SHOWING LOCALITIES OF UPPER CARBONIFEROUS ROCKS CONTAINING PHOSPHATE BEDS.

Compiled from field notes and published maps.

importance, being uniform in character wherever found and containing abundant specimens of a coiled shell, *Omphalotrochus*, which seems to be confined to this bed. This limestone or 'cap lime,' as it is called by the miners, is a valuable landmark in prospecting for the main bed of phosphate. It averages two feet in thickness, is dark gray in color, and hard when freshly exposed, but rapidly weathers brown and finally disintegrates completely. Large blocks of it which have lain on the ground less than two years crumble to pieces when struck lightly with a hammer. In common with most of the other bands, it emits a strong bituminous odor when broken. Analyses show that some of these limestones contain several per cent of P_2O_5. In development work the position in the series of some of the beds can readily be determined from their fossils, even by one with no knowledge of paleontology.

The main phosphate bed is the lowest one in the series at this locality and is just over the basal limestone, which contains much silica, in many places segregated as irregular bands and masses of chert. The phosphate layers are black to brownish in color and finely to coarsely oolitic in structure.

The beds, rich in phosphate, are almost entirely oolitic, the small black granules being densely packed together with but little matrix material and effervescing but very slightly with hydrochloric acid. The phosphate has a bituminous odor when freshly broken. As the number of oolitic grains, and therefore the phosphate content, decreases, the beds assume more of the character of oolitic shale or limestone.

Several thousand tons of phosphate from the main bed at Montpelier, the whole of the material 5½ to 6 ft. wide between the inclosing limestones being mined and shipped, showed a remarkably uniform content, the average of a large series of analyses on carload lots giving a total of a little over 32% P_2O_5, equivalent to 70% bone phosphate. As the result of a careful experiment, it was found that a cubic foot of the phosphate in the main bed weighed 150 lb. This gives 13.3 cu. ft. per ton.

The stratum varies considerably in hardness, the lower two feet being very hard and blocky and the upper portion being softer, with a more shaly structure.

In early days the dark shales associated with the phosphate were, owing to their bituminous odor, frequently taken to indicate the presence of oil or coal, and the deposits at Montpelier were filed on as coal lands and considerable work was done in the effort to find that material.

As the dip is low at this place, the beds are worked as an ordinary flat coal seam with pillar and stall. The phosphate is mined by both open-quarry and underground workings. A loading platform is placed at the foot of a gravity tramway running up the slope of the hill, the top of the platform being on a level with the main adit. The phosphate rock is delivered at the platform in ordinary cars from both quarry and mine and loaded directly into the wagons through a chute. It is then hauled about 4½ miles to the Oregon Short Line at Montpelier and dumped into the cars through a door in a loading-bridge built over the siding. It is now being shipped to the works of the San Francisco Chemical Co. at Martinez, Contra Costa County, Cal., and there made into superphosphates to be used as fertilizers.

The discovery of these phosphate beds has opened up a new industry in the West, the future of which is largely dependent on the granting of such rates by the railroads as will enable the manufactured product or raw material to be sold in Australia, Honolulu, Japan, and the Middle States, the home market on the Pacific coast being at present too limited.

Decisions Relating to Mining.

Specially Reported for the MINING AND SCIENTIFIC PRESS.

Where an oil and gas lease could be terminated at the end of any year, and prior to the finding of oil or gas in paying quantities, only by the giving of notice a reasonable time before the expiration of such year, it was held that the burden was upon the lessor to prove that the time between the giving of the notice and the expiration of the year, was a reasonable time within which to ascertain whether oil or gas in paying quantities could be found.

Campbell *vs.* Rock Oil Co., 151 Fed. 191.

Purchasers of interest in mining property for a stated sum promised to pay the stated sum in addition as they should receive net earnings, either in association with the vendor or through a corporation succeeding to the ownership and further promised that within a specified time they would begin development of the property with a specified force of men until the additional amount should be paid. A bond was given to secure the performance of the contract and the payment of the additional specified sum. In an action on the bond it was held that the bond created an obligation to pay such stated sum only if it was received out of the net earnings, and that the sum stated was a penalty, and that the penalty could be recovered only on proof that if the mines had been worked the purchasers would have been able to earn the stated amount or some part thereof.

Bluwett *vs.* Hoyt, 103 N. Y. S. 451 (March, '07).

The statutes of Arizona prescribe the manner in which the re-location of a forfeited or abandoned lode-claim shall be made, and also declare that the location notice shall state if the whole or any part of the new location is located as abandoned property, otherwise it should be void. Under these statutes in an action to quiet title the Court held that the word 'void' meant 'voidable,' and that a location notice, defective in that it failed to state that the claim was located in whole or in part as an abandoned claim, might be amended to comply with the statute in the absence of intervening rights.

Kinney *vs.* Lundy (Ariz.), 89 Pac. 497.

In an action to determine the rights of respective claimants to a mining claim under the United States statutes, the complaint must contain a definite description of the particular area in conflict that might belong to each of the adverse claimants, and the judgment following the pleading must also designate the particular part of the area in conflict belonging to each of the adverse claimants.

Smith *vs.* Imperial Copper Co. (Ariz.), 89 Pac. 510 (March, '07).

A quit-claim deed of the coal and minerals under certain land was held to be ineffectual to convey any interest in the coal where no consideration was named. That such a deed after the lapse of 25 years, where there was no severance of the coal from the land, was not good as against a deed from the heirs of the original grantor.

Redmond *vs.* Cass (Ill.), 80 N. E. 708 (Feb., '07).

In a prosecution against miners for "intentionally" entering a mine against caution, and for injuring the shaft of the mine, it was held that the word "intentional," as used in the statute, only required that the act constituting the alleged violation of the statue should be "knowingly" done.

Koppla *vs.* State (Wyo.), 89 Pac. 576. (April, '07.)

Where a miner was injured while riding in a car in a shaft of a mine, the question whether such miner went into the mine in obedience to the directions of the mine superintendent, was a question of fact to be determined by the jury.

Burns *vs.* Old Sterling Co. (N. Y.), 80 N. E. 927. (April, '07.)

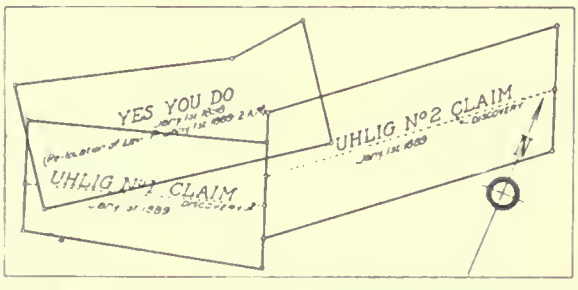
A Celebrated Case.

Written for the MINING AND SCIENTIFIC PRESS
By HENRY M. HOYT 2ND.

Having read in your issue of February 16, 1907, some comments upon the effect of a case decided by the United States Supreme Court on May 29, 1905, Lavagnino *vs.* Uhlig, 198 U. S. 443, I beg to submit my views upon the opinion of the Court as pronounced by Mr. Justice White. My purpose is to ascertain as far as possible to what extent the case may be considered as binding authority in future cases, both from the standpoint of the actual miner locating mineral claims upon the public domain, and from the standpoint of the mining lawyer who is called upon to advise his clients as to the validity of rights acquired by such locations.

The controversy related to locations whose surfaces were in conflict and was confined to the parts in conflict; hence the conclusions reached apply alike to lode and placer claims. In relating the facts I shall omit, as did the Court in its opinion, all those things which were laid aside as unnecessary, confining myself to those things which purported to rule the case. Eliminating extraneous matter therefore, the facts were as follows:

Uhlig and McKernan on January 1, 1889, located two claims named Uhlig No. 1 and Uhlig No. 2, more than seven acres of which at the time of the location overlapped a prior valid subsisting location known as the Levi P. The owners of the Levi P. continued to perform



annual labor up to and including the year 1896. They failed to perform annual labor in 1897. On January 1, 1898, one Smith re-located the ground formerly known as the Levi P. and named his re-location the Yes You Do. In August, 1898, the owners of the Uhlig No. 1 and Uhlig No. 2 filed application for patent. Lavagnino, the then owner of the Yes You Do by grant from Smith, filed an adverse claim. This action was brought in a district court of Salt Lake county, Utah, to determine the right of possession to the conflicting area. The trial court and the Supreme Court of Utah dismissed Lavagnino's action and upheld the Uhlig locations *for various reasons*. The Supreme Court of the United States on writ of error affirmed the judgment and based its conclusions upon *one reason only*, namely, "that at the time when Smith located the Yes You Do claim as a re-location of the Levi P. claim, the land embraced within the location notices of the Uhlig claims, and upon which the Yes You Do overlapped, was not unoccupied mineral lands of the United States, and was consequently not subject to be re-located by Smith." (198 U. S. at p. 157.) It is made plain in the preceding pages of the Court's opinion that the Court proceeds upon the theory that the forfeiture of the Levi P. for failure to perform annual labor did not cast the claim into the public domain subject to re-location, but did cast it into the junior conflicting locations Uhlig No. 1 and 2.

It is respectfully submitted that a serious mistake in law and logic was here committed by the writer of that opinion, and my reasons for so believing are as follows:

On January 1, 1898, the situation of the Levi P. location was this: Under the provisions of Sec. 2321 the owner of the Levi P. could have resumed work and thus saved the claim from forfeiture; or, in default of such resumption and in compliance with R. S. Sec. 2324, any qualified person could enter and re-locate the claim "in the same manner as if no location of the same had ever been made." This was done by Smith, who re-located it as the Yes You Do.

It is conceded in the opinion of the Court, at page 452, "that the Levi P. location, of which the Yes You Do purported to be a re-location, was prior in date to the location of the Uhlig No. 1 and 2." Under R. S. Sec. 2322, so long as the owner of the Levi P. complied with the laws of the United States, he had "exclusive right of possession and enjoyment of all the surface included within the lines" of his location.

This is the ground upon which a location made a few days before the prior locator's time to do annual labor had expired (in the case of Belk *vs.* Meagher, 104 U. S. 279-283) was held absolutely void, and one would suppose that under the statute the nullity of the proceeding would be complete, whether the premature location went to the whole or to a part of the claim. Nevertheless we find the Court in the Lavagnino case ascribing to the locator of the junior overlap laid upon a subsisting valid prior claim a sort of inchoate or "eventual right"—a right to intercept the title to such overlap in case its owner should abandon or forfeit his original, prior, and "exclusive" right thereto, thereby preventing its reversion to the public domain in accordance with the view formerly entertained as to its destiny in such circumstances. Attention should also be directed to the fact that no forfeiture is complete for failure to do annual labor until a qualified locator has, after the expiration of the year, re-located the premises. [Revised Statutes, Sec. 2324. 'Lindley on Mines;' Sec. 643, second edition.] Applying this doctrine to the facts and conclusions of the Lavagnino case, we are confronted by the startling discovery that not until someone *attempted* to re-locate the Levi P., and thereby made the forfeiture complete, did the overlap fall into the hands of the owner of the Uhlig No. 1 and 2, thus changing his "eventual" right into a right of present enjoyment.

But these are only minor difficulties. The real trouble comes on page 456, where the Court concludes that, because a junior claimant gets the ground in conflict if the senior claimant fails to adverse or to duly prosecute his adverse claim, therefore, "as the greater includes the lesser," a like result follows the senior claimant's forfeiture *before* an application for patent by the junior claimant. Quoting from the opinion:

"It cannot be denied that under Sec. 2326, if, before abandonment or forfeiture of the Levi P. claim, the owners of the Uhlig locations had applied for a patent, and the owners of the Levi P. had not adversed the application, upon an establishment of a *prima facie* right in the owners of the Uhlig claims, an undisputable presumption would have arisen that no conflict claims existed to the premises described in the location notice. Gwillim *vs.* Donnellan, 115 U. S. 15, 51, 29 L. ed. 348, 350, 5 Sup. Ct. Rep. 1110. And the same result would have arisen had the owner of the Levi P. adversed the application for a patent based upon the Uhlig locations, and failed to prosecute, and waived such adverse claim.

In both of the supposed instances the necessary consequence would have been to conclusively determine in favor of the applicant, so far as the rights of third persons were concerned, that the land was not unoccupied public land of the United States, but, on the contrary, as to such persons, from the time of the location by the applicant for the patent, was land embraced within such location, and not subject to be acquired by another person. And this result, flowing from the failure of the owner of a subsisting senior location to adverse an application for patent by the owner of an opposing location, or his waiver, if an adverse claim is made, must, as the

greater includes the lesser, also arise from the forfeiture of the claim of the senior locator before an application for patent is made by the conflicting locator, and the consequent impossibility of the senior locator to successfully adverse after the forfeiture is complete."

We confess that we cannot understand the logical step here taken. It reads like an *a fortiori* deduction—because a certain result flows from certain things, it follows even more surely from other things. But, we submit, which is the "greater" and which the "lesser"? Which situation "includes" the other? To our mind the two situations are so dissimilar, so unrelated, that one cannot include the other. In the case of failure to adverse or to prosecute the adverse claim, there are only two parties—the senior and the junior claimant. No "third person" is involved. Consequently, just as in a default judgment, as pointed out by the note writer in 68 L. R. A. 843, or just as in bankruptcy proceedings where a creditor has failed to file his claim within the time provided by law, one man loses and by operation of law, the other party prevails, and there is an end of it—*res judicata*—all the world is concluded by the judgment.

On the other hand, the situation presented in the Lavagnino case includes a new man who was not present and before the Court in the "supposed instances." A qualified locator, complying with the terms of Sec. 2324, has located the land in question when it was not in the exclusive possession and enjoyment of anybody and at a time when, in the words of the statute, it was "open to re-location in the same manner as if no location of the same had ever been made." This new man, pursuant to Sec. 2326, is present in Court and asserts his right to the land.

The only reason why an "indisputable presumption" arose in the supposed instances, that "no conflict claims existed," was because the only living man who had a conflicting right, elected to relinquish that right. This cannot logically justify the conclusion that in a case where the only man who has a conflicting right *is* present and loudly asserting it, the same indisputable presumption should or could arise. *Cessante causa cessat effectus.*

As we have before pointed out, no forfeiture for failure to do annual work becomes complete until a re-location after the time has expired; co-existing with the re-locator's right is the concurrent right of the original locator to save the claim by resumption of work at any moment prior to its re-location. Thus, there is a complete continuity of valid subsisting ownership without an instant's intermission. Therefore, even if we assume (as seems to have been done) an inchoate or "eventual" right in the junior claimant under the Uhlig locations, such right never had any chance to attach for there was no *hiatus* in the title in which it could take effect. Indeed the birth of the new right of the re-locator is in law the cause of the death of the old right of the original locator.

Only one plausible theory suggests itself to account for the conclusion reached by the writer of the opinion in Lavagnino *v.* Uhlig. The word forfeiture is sometimes appropriately applied in certain legal relations where one man forfeits to another. If a senior locator could, with the same propriety, be said to forfeit the ground in conflict *to the junior locator* by failure to adverse, we can see that it might with accuracy be said that even more clearly should he be held to have done so by forfeiting his rights before the junior applies for patent, thus terminating his right to file an adverse claim. This view, while furnishing a possible explanation for the language employed in the Court's opinion, lends no aid to the solution of the difficulty, for a forfeiture under Sec. 2321 does not purport to work a transfer of interest to any other person, but simply to extinguish the original claim. In this respect it is like an abandonment; it merely restores to the public domain that which had been segregated therefrom.

A careful and painstaking study of the unusual doctrine of the Lavagnino case inevitably leads to the conclusion that its logic cannot be reconciled with many doctrines long since supposed to be settled; its admitted result (p. 456) is to qualify Sections 2319 and 2324 R. S., whereas a natural construction of the law under the facts presented would have led to harmony of all these sections. Its effect seems to us likely to work the very evil which the same Court aimed to avoid in Belk *vs.* Meagher, "to encourage unseemly contests about the possession of the public mineral-bearing lands, which would almost necessarily be followed by breaches of the peace."

As a matter of fact the immediate effect of the decision in Lavagnino *vs.* Uhlig in at least one rich placer camp was to cause a multitude of 160-acre placer claims to be located, practically covering or blanketing all the locations of probable value in the country. For a time it looked as if the court was going to be swamped with an avalanche of litigation predicated upon the Lavagnino decision. But the judge of that country wisely discouraged that tendency by declaring in a decision which he rendered in granting a new trial, what he believed to be the scope of the Lavagnino decision and the extent to which it was to be regarded as authority. He said:

"The doctrine in that case is so at variance with the doctrine of Belk *vs.* Meagher, 104 U. S. 279, and the long line of cases which follow Belk *vs.* Meagher, and in the opinion of this Court is likely to work great injury to rights hitherto regarded as vested, if taken as overturning the law of Belk *vs.* Meagher in respect to the effect of forfeitures upon the rights of other persons attempting to fasten locations upon the ground which had been covered by the forfeited claim, I therefore believe it to be a case binding only in adverse proceedings, where a patent has been applied for, and within its own limited circle of exceptional facts and circumstances."

(Judge Alfred S. Moore of the second division of Alaska, in Montague *vs.* Labay, 2 Alaska Rep. 575).

If these views correctly state the law, it would seem that the old doctrine of Belk *vs.* Meagher, 104 U. S. 279, may still be regarded as sound and that the abandonment or forfeiture of a location will not cause it to inure to the benefit of a junior overlapping claimant, unless he, pursuant to R. S. Sec. 2324, shall have re-located the ground after the forfeiture or abandonment, and before the accrual of intervening rights.

It may be proper to note that Mr. Justice Brewer "concurs in the result" (198 U. S. at p. 457). This can only mean that he did not concur in the reason. It may not be improper to also note that on the day of the decision of Lavagnino *vs.* Uhlig, May 29, 1905, twenty-four other decisions were handed down, in eighteen of which were opinions by the various members of the Court. The conjecture may be hazarded that this mass of work which had to be disposed of before the adjournment of the Court for the summer may have made it impossible for the Lavagnino opinion to be scrutinized very closely by all of the justices who concurred. In any event, taking everything into consideration, it seems safe to assume, when the same Court next has occasion to rule upon a like situation, that while the judgment in the Lavagnino case may be approved upon the reasons, or some of them, adopted by the Utah Court, the reasons stated in the official report will be disapproved and the public assured that the doctrine of Belk *vs.* Meagher is still unshaken.

A Tin Deposit Near Spokane.

Written for the MINING AND SCIENTIFIC PRESS
By A. R. WHITMAN.

Within the last two months there have been made public the facts of a new mineral discovery near Spokane, Washington. The quite natural scepticism of the public as to the conservatism of the press announcement, has prevented the awakening of a general interest in the finding of a deposit of mineral so rare and heretofore so unsuccessfully mined in this country. Nevertheless a seemingly rich deposit of tin ore has been uncovered almost in the suburbs of this busy mining centre.

The deposit is situated on the south slope of Silver hill, which lies 12 miles south of Spokane, on the Palouse line of the Spokane & Inland railway. This hill is a low spur projecting over the edge of Moran Prairie from an irregular range of moderately high hills, having a northwesterly trend. This range was originally formed of sedimentary rocks, but it has been profoundly altered by a granite eruption that affected this whole region. At the base of the hills lies the great Columbian basalt sheet, which flooded the country after the hills had been eroded. At some time subsequent to the granite eruption another igneous invasion occurred in which more decidedly acid lavas played the leading part. Of these the most conspicuous and most important at the locality in question was a tin-bearing felsite.

After the felsite intrusion, the locality was subjected to stresses and strains from all directions, which created fissures of various sizes, the principal ones ranging themselves into a system having a strike a little south of west and dipping at all angles. These crevices immediately became the vents for the heated waters and steam following the eruption; and widely scattered veins of quartz now bear evidence of the activity of these thermal springs.

At Silver Hill the sedimentary rocks are metamorphosed into quartzite, andalusite slate, mica schist, and, in some places, to a fine-grained, highly feldspathic granite. They were distorted and shattered by the granite intrusion till it is difficult to guess at their original form and position. The granite did not confine itself to fissures nor to the bedding planes of the sedimentaries, but invaded them in all directions, breaking them into blocks and shreds, and mixing these promiscuously. Thus the granite cannot be said to lie here nor there in the hill, but comes to the surface at irregular places. The felsite, however, seems to conform to a system of fissures, resulting in the arrangement of the outcrops into four zones, striking north-northwest.

Where the south slope of the hill begins to turn westward, the most pronounced and richest zone makes its appearance. This has been explored by an open-cut, called the West cut, which penetrates the hill for 30 ft., exposing a breast 15 ft. high. In this breast the orebody is plainly disclosed. About 200 ft. east of this there is a parallel zone, which appears to be barren of tin. Three hundred feet east of this is a third outcrop, which, though carrying only a small amount of tin, seems to be part of an intrusion that has given rise to numerous large pieces of float, which are fully as rich in tin as the ore of the West cut. Two hundred feet farther east from this point is a second open-cut called the East cut. No felsite is exposed here, but about 180 ft. east of it there is a single outcrop of barren felsite.

At the West cut a dike-like body of granite has broken through the sedimentaries, which here strike 10° south of west, and dip north at an angle of about 45°. The granite mass is 18 ft. wide, and its east wall strikes northwest and dips westward at an angle of about 60°. The felsite appears to have ascended along this east wall, forcing its way along the bedding planes of the sedimentaries, and in some places thrusting them back bodily, causing them to be laminated at right angles to their strike. This has given the body thus far exposed such a form that a cross-section shows three distinct bodies separated by strata of metamorphosed sandstone and abutting against the granite. The upper body constitutes the outcrop. It is much altered and appears to carry but very little tin. The middle lobe has a semi-lenticular cross-section, the centre of the lens, 5 ft. thick, in contact with the granite, and the extremity extending out 20 ft. into the sandstone. The three edges of this body are rounded in such a way as to suggest extreme viscosity in the original fluid; and the metamorphism of the sandstone to mica schist for about an inch back from the contact suggests a high temperature and slow rate of cooling the mass. This body probably averages 6% tin. The lower lobe is about 25 ft. long and of undetermined breadth. The upper portion of it resembles the middle lobe, but the under side of the lens, about 10 ft. from the granite, turns down parallel with the granite, giving the lower part of the body the appearance of a dike. Here it is that the sedimentaries have been thrust back and laminated. The tin contents of this body probably amounts to about 7 per cent.

The felsite consists mainly of a much altered and kaolinized feldspar, which has the appearance, though not the true composition, of albite. The quartz is inconspicuous and often difficult to distinguish from the feldspar. Muscovite and biotite micas are abundant near the periphery of the intrusions, and black tourmaline is associated with them. The inner portions of the bodies are characterized by the presence of lithia mica, and small pink blotches due to clusters of the capillary prisms of rubellite. In some places the cassiterite is seen near the periphery, but it is mostly confined to the interior of the body. It is black, and contains a small amount of iron, but is otherwise unusually pure, yielding on analysis 73% tin. It occurs in irregular, but decidedly angular masses, ranging in size from rectangular specks an eighth of an inch in diameter, to masses, in one or two cases, six inches in cross-section; the average mass would probably measure one inch by one and one-half by one-half inch. In the other felsite zones rubellite is common, but the black tourmaline seems to be most plentiful where there is little or no tin. One of the most interesting and significant phases of this occurrence of ore consists in the association of other metals with the tin deposit. The chief of these metals are lead, silver, copper, and tungsten.

Nearly horizontal veins of quartz sever the orebodies in the West cut, and others follow their east profile. These are practically barren save where they come in contact with the felsite. On this contact occur both wolframite and scheelite in such a manner as to suggest a metasomatic replacement of the feldspar by the scheelite, and the subsequent alteration of this mineral to wolframite, through the replacement of its calcium by iron and manganese, leached from the constituents of the eruptives. A single specimen taken from the contact will illustrate this. It shows a band of wolframite spangled with muscovite mica, cemented on one side to the felsite and on the other to greenish yellow scheelite. The periphery of the intrusions, as has already been stated, carries muscovite and biotite micas. In this specimen muscovite plates are conspicuous in the felsite; and the presence of the same mica in the wolframite in about the same proportion strongly suggests that the feldspar that originally surrounded the plates has been replaced.

A still more interesting occurrence of tungsten, and incidentally, a proof of the secondary character of the

wolframite, exists in the East cut. Here the granite is seen in contact with the sedimentaries, which it has bulged upward and broken through. They are metamorphosed, in part, to a fine-grained, highly feldspathic granite, and both rocks are full of small fractures and veinlet-, dipping in all directions. These are iron-stained, but otherwise present no unusual appearance. However, within six feet of the surface where the metamorphic granite is soft and decomposed, and deeper down where the water has leached out the soluble materials along the crevices, what appear to be nodules of quartz are seen within the granite close to the veinlets. Many of them are enveloped in a crust of black mineral. Examination shows that some of them are quartz, while those encrusted with the black mineral are scheelite, the black mineral being wolframite. These nodules vary in size from that of a pea to oval-shaped masses three inches in diameter. Some of them include small bits of the unaltered granite, while all are more or less securely cemented to the feldspar in the surrounding rock. These facts seem to indicate that the nodules are concretionary replacement growths, originating from the permeation of the granite by the tungsten-bearing silicious waters that filled the crevices in the granite with quartz. The formation of the wolframite must clearly have been a secondary process, due to the circulation of solutions carrying iron and manganese.

The occurrence of argentiferous galena at a couple of points on the hill is also interesting. One of these is a vertical fault-fissure about 50 ft. below the East cut. This is filled with an 8-in. quartz vein, which carries the galena. The other point is about 300 ft. northwest of the West cut, and as it is similar to the other, and a much better illustration, it is more deserving of a detailed study. This is a quartz vein lying within a fault, conformable at this point with the sedimentary strata within which it lies. About 50 ft. in the direction of the dip of the vein is a wide granite intrusion, that deflects its course downward along the nearer wall of the vein, which is 18 in. thick where seen in the stripping on the hillside and lies on a gouge-covered stratum of silicified shale. This vein has a remarkably symmetrical structure. On the foot-wall, in contact with the shale, occurs the galena; next comes a mixture of black tourmaline, feldspar, and quartz, the tourmaline having its characteristic crystallization and the quartz having the form of small rice-like globules within the feldspar. Gradually, as the barren centre of the vein is approached, first the tourmaline disappears and then the feldspar. Then, as the hanging wall is approached, the order is exactly reversed.

On the foot-wall, where oxidation has proceeded more slowly, the galena is found in its incipient stages of alteration. Several specimens were secured that showed a small mass of galena surrounded by a dark grayish brown mineral, which analysis proved to contain lead sulphate and carbonate; and this was coated with a greenish yellow crust of cerussite. On the hanging wall, where oxidation is complete, the lead exists only in the form of a yellowish powder of cerussite in cavities in the quartz.

The origin of this vein is not a subject for discussion here, though it might be suggested in passing that its form and contents seem to indicate that the mineral deposition was begun by steam or highly heated waters, and that as the aqueous eruption subsided the cooling water first lost its power to carry tourmaline, then feldspar, and finally filled up the vent with pure silica.

This brief description of the conditions at Silver Hill does not purport to be in any way exhaustive or final, but is a mere collection of notes from a hurried reconnaissance of the field.

Letters of a Self-Made Miner to His New Foreman.—IV.

Written for the MINING AND SCIENTIFIC PRESS
By MATT. W. ALDERSON.

My dear Tom:

You have worked in mines where the practice was to take all the ore out of the shoot opened, until it pinched on the sides and bottom and then to leave it as worked out. We don't work the Imalulu that way. I never expect to live long enough to see more than a fair start at working it out, and I wish you to work the property every day as if you expected it would be yours ten years ahead and you would like just as much good ore in sight as possible and the mine in fine shape in every way at that time.

Most mine owners pocket the profits that come easily and then turn a cold shoulder on the mine that has been good to them. Fifty per cent of the profits of operating this mine go back into development work, so you will always have men opening up new territory.

You will work the lean parts of the mine first, keeping the large size orebodies in reserve as much as possible. Each time you leave a stope and resume work there you entail loss of time and create needless expense. The ground gets dirty and discolored, it takes a man a shift or two to get the lay of the ground, position of the ore, etc., and to handle himself to best advantage. Except where, because of extent and value of orebodies, it is decided to keep them in reserve, you will work all places to a finish when once you begin.

Before opening a new stope, consider the most economical way of doing so, having from the start the end in view, the storing of the ore for the men to stand on, and the removal of the ore and waste so as to avoid mixing them. Where a stope is started on a narrow seam, open out well to begin with. It is always expensive to follow small seams without first opening out the ground. Have stages put in promptly to enable your men to work to advantage and check the falling of ore to the level as soon as expedient to avoid the needless expense of shoveling.

When hoisting it is very important that the skip be kept running without avoidable intermissions. Delays which cause a stop in tramming in the levels, filling cars, etc., are expensive. Without system and regularity here you may easily paralyze the efforts of everyone above ground and below.

The foreman of the mill is on the same level as yourself. He has complete charge of the mill. Neither of you has any authority over the other, but you will work in harmony with each other. You furnish the raw material and he works it up. You will consult his wishes in supplying ore from the mine. Ordinarily you will supply him with mine run (that, with us, is any ore running under $10 a ton), but you will be prepared to furnish him on short notice such ore of better grade as may be necessary to bring the month's output up to the point we wish.

You will break and send to the mill, ore assaying as low as $2 a ton, not that there is a profit in the milling of this grade, but driving in it you may open into something better. Ore assaying $10 and over you will keep in reserve in the mine except when called upon to do otherwise.

You will place a number upon each new chute in accordance with the number scheme of the mine. (See a number scheme for mines, MINING AND SCIENTIFIC PRESS, Oct. 24, 1903. That number scheme again, MINING AND SCIENTIFIC PRESS, Dec. 12, 1903.) You will see that the

stope maps are brought up to date at the end of each month.

You will see that any part of the mine, where timbering is necessary, is well timbered. In no case will you allow sprags to be used for men to stand on and work. See that stulls are put in, in every instance.

You will allow no accumulations of rubbish or waste in any part of the mine to interfere with free access.

You will train your car men to keep their cars well oiled, their tracks properly ballasted, thoroughly drained and free from any spilled ore or waste.

There are two safety exits from the mine, one on either side of the working shaft. You will see that these are kept in perfect order and that connections by strong ladders are made with lower levels as they are extended. You will have your men make their exit from the mine occasionally by these routes that they may be perfectly familiar with them.

You will be expected to know that each man does his work. This does not mean that you make yourself needlessly officious and be afraid to trust your men out of sight. I knew a foreman who thought he must tell each of his men how to point their holes. I generally tell a man what I wish done and leave him free to go at it in his own way. One man will bring the roof down with an upper. Another would put in a back hole; one man will go out on a bench and put in a down hole; another would put in a lifter and tosser. Why should we care? Results are what we want and you should be able to judge your men by results. In this connection it will be well for you to carry a small memorandum book on which to enter when and where each man commences work. At various times you may enter memorandum of how he is progressing. At the end of each month you will post from this into a book, which you will keep for this purpose, the number of feet driven by each man. You may think this hard to carry into effect, and there will be places of which it will not be easy to keep a perfect record; but commencing with drives, raises, etc., you will find it easy to expand to cover more work than you might think. By so doing you have something definite, you are not judging a man by some one day's work, when he didn't feel his best and did poorly, or felt extra well and did splendidly. In time you will appreciate the fact that what is true of every other line of work is true of mining; accurate knowledge of what is done by your employees beats guesswork.

From the present appearance of the mine it will not be long before you have quite a force under you; so it is important that you start with a system that can be readily expanded as required. Shift-bosses and other subordinates will be necessary, as it will be impossible for you to dictate the details to each individual worker. When this time comes you will give your orders to the bosses only, holding them responsible for any shortcomings in the men under them.

You will file an invoice at the end of each month of such supplies as you have on hand, accompanying it with requisition for what is needed. You will keep a good reserve always on hand, and on receipt of new stock you will move the old forward or so place it that you will be sure to take it first when issuing to the men.

There are mines where the employees are allowed to help themselves to such supplies as they think they need. I knew a man who quit work at such a mine one spring with several hundred pounds of powder and other supplies which he had accumulated during the winter. There must be no laxness by which such a thing will be possible under your administration. I expect you to so keep your records that you will know at the end of each week the exact number of candles and sticks of dynamite used by every man on your force.

You will keep yourself so familiar with the mine that you will be able to put on extra men at any time where they can do work to advantage.

You will see that every man has an abundant supply of tools. No man can do good work with a dull tool and you will train your men to send their drills to the shop before they are unnecessarily dull.

You will notice the manner of your men in handling explosives. If any one is careless and neglects to adopt suggestions you may make to him, let him out. You have precious lives in your charge and you will run no avoidable risk.

Finally: Whatever you do, do as well as you know how. Allow nothing to be slighted. Close no level nor allow same to be blocked, but timber and protect every one, so work may be resumed at the face at any time.

Sincerely yours,

TIMOTHY STRONG.

MANGANESE IN INDIA.—Just at present there is a veritable boom on in the manganese ore industry. Many discoveries are being made and the ore seems to be pretty well distributed throughout western and southern India. Some rich deposits have been discovered six miles outside the Mysore frontier in the Bellary district, assaying 51% manganese. All the ore from Mysore and Goa is shipped from the port of Mormugoa, which possesses facilities for loading direct from the wharves. During the calendar year 1906, there were 343,346 tons of manganese ore shipped from the port of Bombay, as compared with 213,860 for the previous year. It is expected that the present year will see an enormous increase over these figures. According to one of the largest shippers in Bombay, manganese ore mined in India varies from 40 to 53% metallic manganese, silica 3 to 12%, and phosphorus from 0.2 down to 0.03%. The largest exporters from India sell their ore as 50% metallic manganese, and sometimes as low as 45%. The industry is at present suffering from lack of proper transportation facilities. The mines are all situated off the lines of railways, and the ore is freighted in bullock carts to the nearest station. Owing to the general prosperity of the country, there has been an enormous shortage of freight cars on all lines and all industries, including that of manganese ore mining, have suffered thereby. There are thousands of tons of this ore piled up at various railroad points for which no cars can be obtained.

IT is surprising that the United States, having extensive deposits of arsenical ores and being the leading consumer in the world, should be dependent for its supplies of arsenic and arsenical compounds largely upon England, Germany, Spain, and Canada. The United States utilizes over half of the world's production of metallic arsenic, white arsenic (arsenious acid), and arsenic sulphides (orpiment and realgar). Another anomaly is the waste by burial in this country every year of several hundred tons of arsenic sulphide which is obtained in purifying sulphuric acid at chemical manufacturing works. This subject offers an opportunity for profitable research to those whose inventive minds may evolve an economical method of treating this arsenious by-product so that it may become of industrial value. In addition to the arsenic recovered from arsenopyrite mined in Washington and from the ores which occur in Virginia, attempts are being made to recover the arsenic which is going to waste in the smelter fumes at Anaconda, Montana.

A Comparison of Coal and Oil Muffle Furnaces.

Written for the MINING AND SCIENTIFIC PRESS
By GEORGE J. YOUNG.

The two furnaces (Denver Fire Clay Co.'s soft-coal furnaces) compared were identical in all dimensions with the exception of the combustion-chambers, the combustion-chamber of the oil furnace being altered to admit of better flame distribution than could be obtained by using the coal combustion-chambers. The two drawings (longitudinal and transverse sections) give all the important diversions. The dotted lines give the general shape of the coal combustion-chambers.

The stoking of the coal furnace was carried out in the

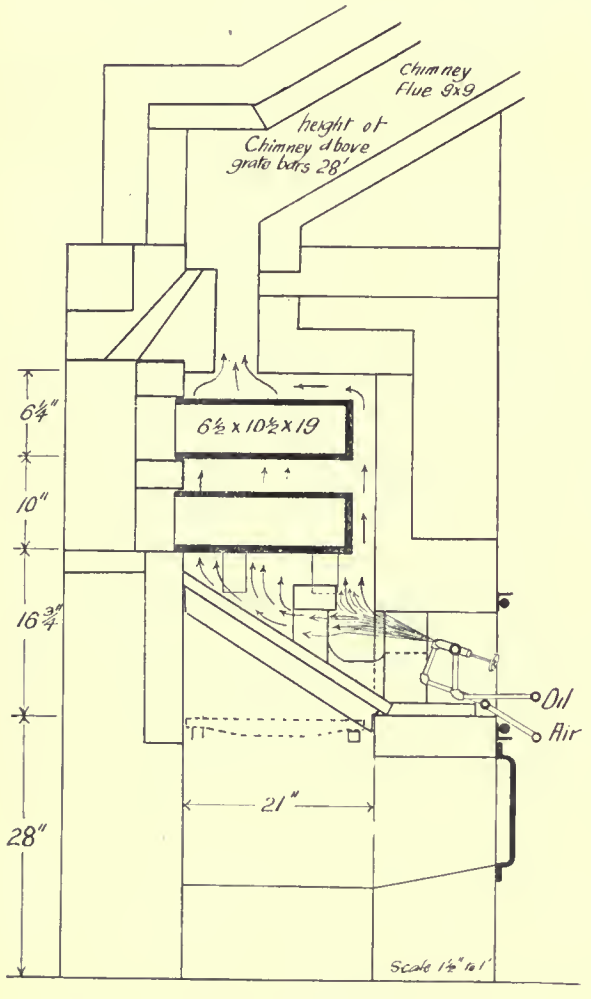


Fig. 1. Longitudinal Section.

following manner (see Fig. 3): The first bed of coal was allowed to burn down to a depth of 2½ to 3 in.; instead of then firing with an even bed, all of the coal was deposited to a depth of about a foot, directly in front of the stoking-door; as the bed of coals in front burned down, enough of the coal from this heap was spread over the front bed to even it and fill any air-holes and fresh coal was heaped on the back bed, the ash-pit door was left open about 3½ in., with the damper wide open. The effect of this method of stoking was to give a hot fire concentrated about both muffles and to give moderate flue-temperatures and a comparatively short flame. The other important result was a decided saving in fuel. The temperatures of the muffles and flue were taken and plotted in Fig. 4.

The oil flame was regulated by both air and oil until the maximum intensity of combustion was obtained. This was determined by direct observation on the flame through a blue glass at the air-holes surrounding the burners. The burners were of the ordinary spray type, with the following dimensions:

Diameter.	Inch.
Needle opening of burner	0.04
Oil opening of burner	⅛
Air opening of burner	⅛
Oil-pipe	¼
Air-pipe	¼

Pressure of oil: 24 to 25 lb., closely regulated by reducing valves.
Pressure of air: 24 to 25 lb., same regulation.

The temperatures of both muffles and flue were taken at the points corresponding to the coal furnace, namely,

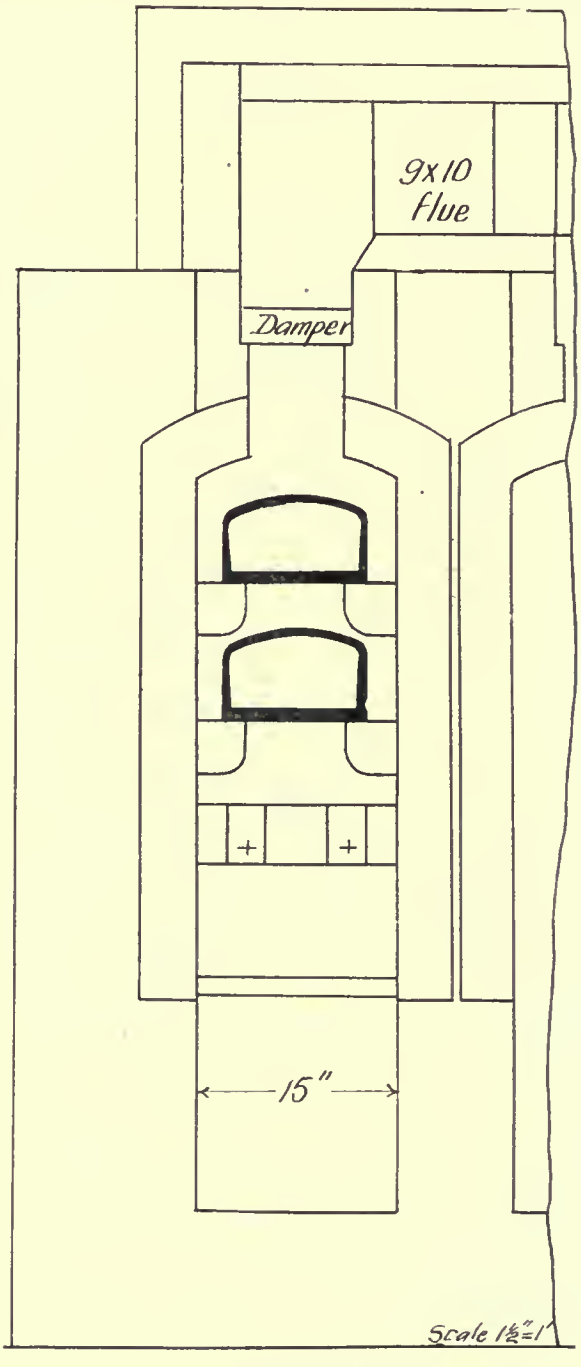

Fig. 2. Transverse Section.

at the centre of each muffle and in the flue through the damper-opening. Observation through the damper-opening enabled the flame to be regulated. Little or no smoke came from the chimney and no carbonization on flues was noticed.

Crude oil of 24° B. was used and the consumptiou of oil was determined by weighing. The coal used in the coal furnace was Utah coal of medium grade and was also weighed. The air was measured at the compressor and the power required was determined by watt-meter readings. Consumption of muffles and grate bars was

determined by the laboratory reports extending over a period of one year.

The consumption of coal averaged 34 lb. per hour. With a better grade of coal and more careful firing a coal consumption of as low as 25 lb. per hour has been obtained with this furnace.

The consumption of oil during the observed period was

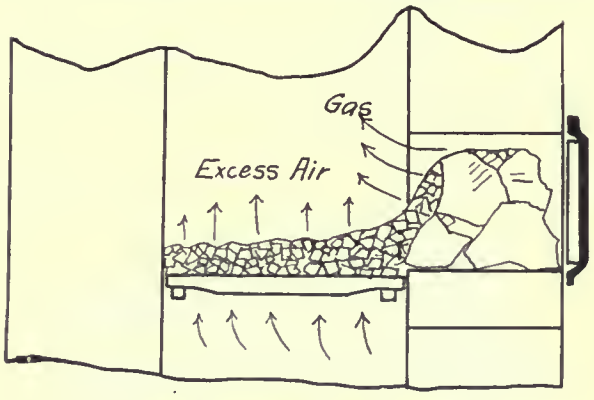

Fig. 3. Stoking of Coal Furnace.

at the rate of 2.75 gal. per hour. Consumption of air was 1.42 cu. ft. for both burners. Power required for air per hour, 540 watts.

The temperature curves for the upper and lower muffles of the coal furnace indicate a more even heating of both muffles than in the case of the oil furnace, although with the latter a higher temperature was obtainable. The temperature in the combustion-chamber of the oil furnace (close to the burners) ranged between 1,400 and 1,600° C. The even heating of both upper and lower muffles in both furnaces was quite noticeable.

The comparative costs are tabulated as follows:

Details.	Cost per hour. Coal. Cents.	Oil. Cents.
Coal, 34 lb. @ ½c. lb.	17	——
Oil, 2.75 gal. @ 6c. gal.	—	16.5
Power for compressed air @ 4c. kw. hr.	—	2.2
Muffles	4	4.0
Grate bars @ 5c. lb. C. I.	3	——
Total	24	22.7

The main advantages of the oil furnace over the coal furnace, apart from the slight one of operating cost, are its cleanness, ease of regulation, the high temperature

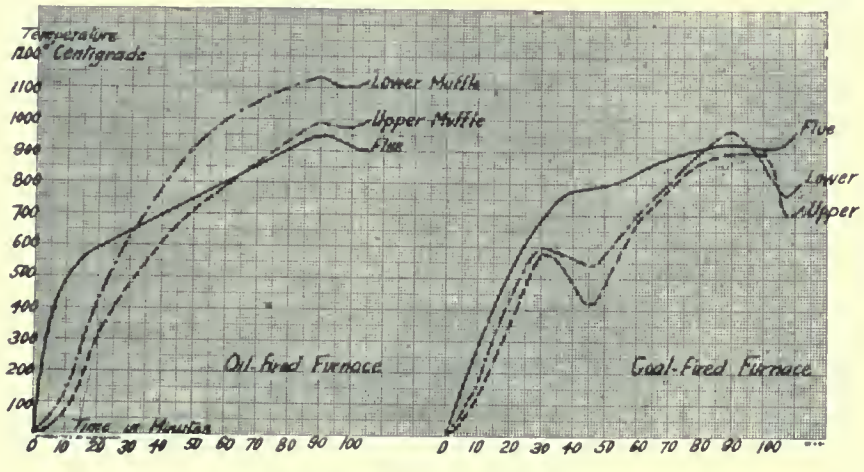

Fig. 4. Table of Temperatures.

quickly reached and easily maintained, and the moderate amount of attention required. The principal objection to be noted is the noise of the burners.

The temperature curves show the difference between the combustion of the coal and oil. With the coal furnace combustion takes place throughout the combustion-chamber, with the oil the combustion takes place principally in the lower part of the chamber. This accounts for the small difference of temperature (15° C.) between the upper and lower muffles in the coal-fired furnace and the greater difference (140° C.) in the case of the oil furnace. The relatively lower flue temperature of the oil furnace is due to the same cause.

DURING the last five years there has been a decided advance in the manufacture of various forms of appa-

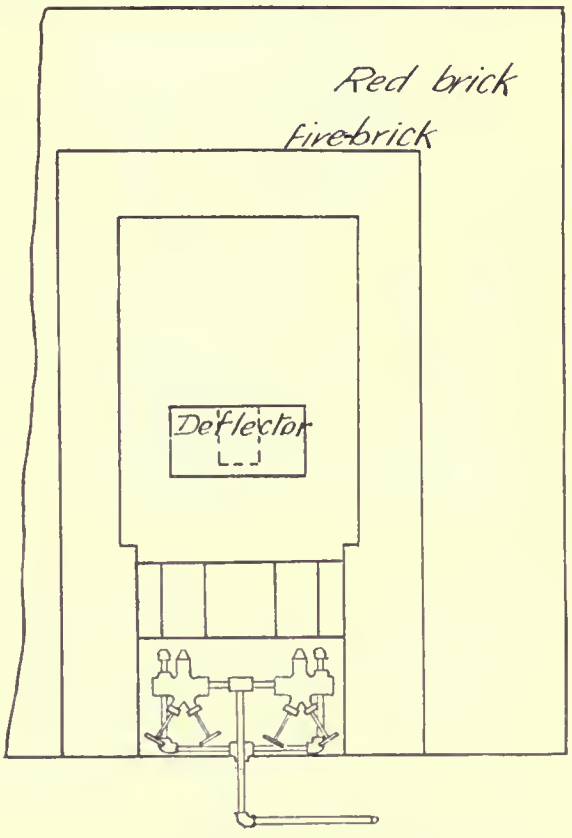

Fig. 5. Plan at Burner Level.

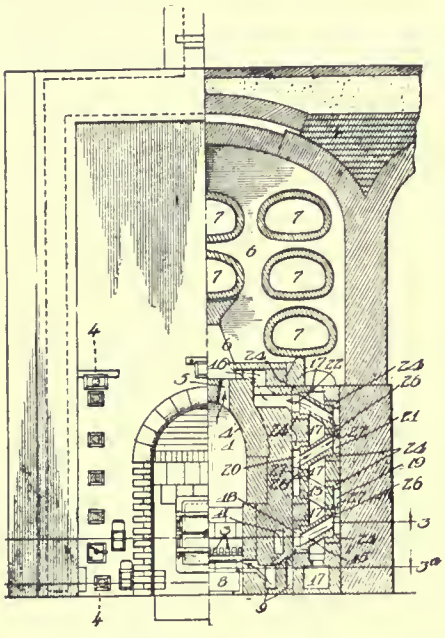
ratus for lighting purposes. These investigations and inventions have led to the practical introduction of certain metals and metallic oxides into the arts which before this time had little or no commercial value. With the demand for these metals and metallic oxides there at once arose the question of their sources of supply, which has resulted in the mining of a number of minerals that were formerly supposed to be extremely rare in their occurrence, but which have now been found in considerable quantity. Experiments are being carried on with still other metals in regard to their usefulness for the manufacture of various incandescent and electric lamps. The metals and the metallic oxides that are now being used and experimented with are tantalum, cadmium, zirconia, thoria, yttria, and cerium, lanthanum, and didymium oxides. With the exception of cadmium, all these materials are being used commercially in the manufacture of different lamps and are obtained from the following minerals: Monazite, zircon, gadolinite, columbite, and tantalite. The use of cadmium for lighting purposes is still in the experimental stage. Cadmium lamps have been made, but are still principally of scientific interest.

MINING AND METALLURGICAL PATENTS.

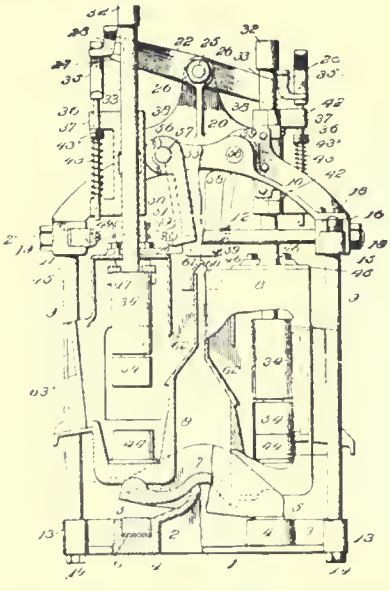
Specially reported for the MINING AND SCIENTIFIC PRESS.

RECUPERATIVE MUFFLE-FURNACE.—No. 852,506; Lazruby C. Hamlink, St. Louis, Mo., assignor to Gas Bench Construction Company, St. Louis, Mo., a Corporation of Missouri.



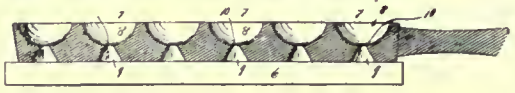
In a recuperative furnace, a downwardly leading outlet flue for the waste gases, and a plurality of inclined recuperator flues extending in zigzag arrangement up the outlet flue and discharging into the combustion chamber, said recuperative flues being composed of a succession of rows of separate hollow tile, the upper ends of each row of which are arranged to discharge into the lower ends of the next superjacent row, and means for admitting secondary air into the lower row of tile, to be heated by the waste gases of the surrounding outlet flue and discharged into the combustion chamber.

STAMP-MILL MACHINERY.—No. 852,756; James C. Anderson, Highland Park, Illinois.



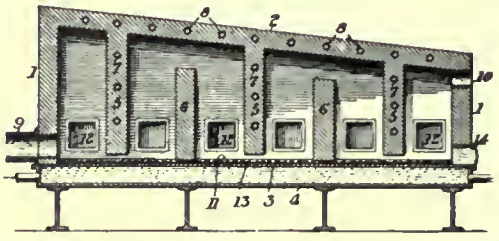
In a stamp mill, a pair of vertically movable stamps, a pair of vertically movable mortars, each located below and in alinement with the respective stamps; and a power transmitting rocker or lever mounted vibratively upon the base of the machine and supporting at each end thereof one of the vertically movable mortars, whereby the momentum shock produced by the descent of each stamp alternately, will through the medium of the vibrative rocker cause the material in the opposite mortar to be crushed between said mortar and the stamp in alinement therewith.

ASSAYER'S POURING-MOLD.—No. 850,811; John J. Bailey, Victor, Colorado.



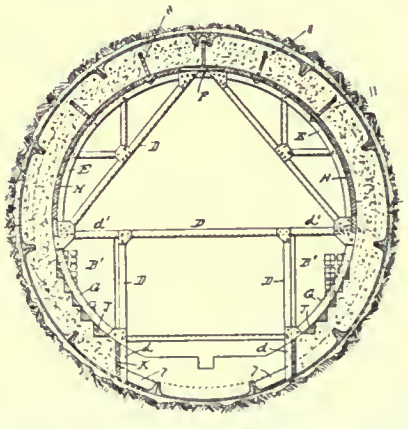
An assayer's pouring mold provided with a receptacle containing two compartments communicating with each other by a relatively small orifice.

METALLURGICAL CONDENSER.—No. 851,520; Woolsey M. Johnson, Iola, Kansas.



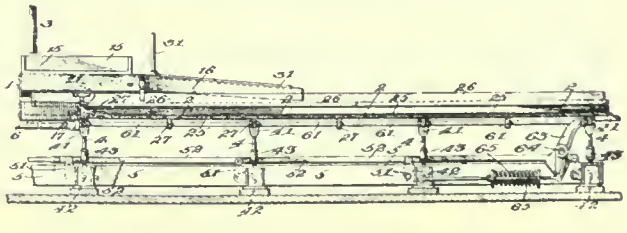
A metallurgical condenser having an interior non-metallic surface, a base plate of metal, and means for cooling said base plate, and means for directing the vapors in a tortuous path through said condenser.

MEANS FOR LINING TUNNELS.—No. 852,891; Ernest W. Moir, London, England, assignor to S. Pearson & Son, Inc., Long Island City, N. Y., a Corporation of New York.



The combination of a tunnel composed of flanged segments with a supporting frame for lagging for use in lining the tunnel and detachable means for hanging the frame from the flanges of the tunnel segments.

ORE-CONCENTRATING TABLE.—No. 850,391; Howard D. McLeod, Great Falls, Montana.



An ore-concentrating device comprising a vibratory table, a stationary rigid frame beneath said vibratory table, a plurality of inflexible bodily-adjustable supports positively secured both to said table and to said frame for resisting both tensile and compressive strains, and means for simultaneously and equally adjusting said supports bodily, whereby the distance between said table and said frame may be altered.

Editorial.

ANYONE READING the account of the trial at Boise, must have been impressed with two features of the confession made by Orchard; the first is the cheapness of human life as gauged by the payments he claims to have received for the murders he committed, and the second is the utter incapacity of the police in Colorado, Idaho, and California, in that they failed to stop a series of such stupid crimes.

TRAVELERS who pay excessive toll for the use of Pullman cars, and support a large number of sycophantic Africans, will be glad to know that some of their money is being usefully employed in developing the mineral resources of Montana. An Afro-American Mining & Milling Company has been formed by a number of colored gentlemen, who have devoted $500,000 to the purchase and operation of mining properties in three different districts.

DURING THE YEAR 1906 the Robinson mine, the leading gold mine of the world, produced £1,027,240 from the treatment of 362,367 tons, giving a profit of £632,382. Dividends were distributed to the amount of £550,000, this being 20 per cent on the capital of the company. The ore yielded 56s. 8.35d. or $13.60 per ton, and it is estimated that the extraction averaged 93.183 per cent, this being effected by 210 stamps and 3 tube-mills. The ore reserves are estimated at 2,180,700 tons, of an average assay-value of $14.22 per ton.

MANUFACTURERS OF MACHINERY are usually enterprising, for the business to be successful requires a great deal of intelligent energy, so that the multitudinous catalogues and pamphlets issued by them rarely warrant special comment. But we do not hesitate to compliment the Bucyrus Company on the publication of the President's message on the Panama canal, and the incidental advertisement, by means of beautiful photographs, of the Bucyrus Company's contribution to the building of that canal, in the form of dredges and cranes. The pamphlet, or album, does credit to the printer, the engraver, and the originator.

THE DELAY in bringing the Cerro de Pasco mines to a productive stage emphasizes the large amount of time and money required to make a profitable enterprise out of a deposit of copper ore. The same feature is illustrated by the Tanganyika Concessions. Five years ago these Peruvian and African mines were heralded as sources of copper to be made immediately available, but as yet they have made no noteworthy contributions to the copper market. Even Butte, where so many new mines have been opened during the last three years, is

barely able to hold its own, despite the favorable discoveries in the Anaconda properties. It takes a gold mine to make a copper mine—and time.

AMONG THE HUMORS of the numerous strikes that are making San Francisco and the cities on the Bay a playground for industrial blundering, is the claim of the laundry workmen that the students in the University of California are 'unfair' because they do their own washing. A strike of the employees in the laundries has diverted business to the French and Chinese establishments, and has made washing both bad and expensive. A few of the students lately had the energy and thrift to do their own washing and some walking delegate from the unions has discovered this startling fact, with the result that he has injured his cause, as most of them do, by inviting ridicule. The bakers will soon object to home-made pastry and then we shall be deprived of the pie "that mother used to make." Even worse, the market gardeners will refuse to sell vegetables to those who imitate "the gardener Adam and his wife" by growing a little lettuce. If resentment against an ignorant tyranny will not break it, it may be that the ridicule provoked by foolish acts will serve to put an end to an intolerable condition of affairs.

State Geological Surveys.

GEOLOGICAL WORK is appreciated in Illinois. We note that the Legislature of that State has voted $40,000 per annum for the work of its Geological Survey, this being an increase of $15,000 as compared to the last appropriation. The Legislature has also endorsed the plans for making maps and examinations of swamp lands and tracts subject to overflow, with a view to reclamation. We congratulate Mr. H. Foster Bain, the Director of the Geological Survey of Illinois, to whose energy and ability this action of the Legislature is a direct compliment. In Arkansas, a geological survey has been re-established and Mr. A. H. Purdue, professor of geology in the State University, is likely to be put in charge. He is a competent man, from whom good results may be expected. In Tennessee, the Governor urged the Legislature to recognize the geological needs of the State, but unfortunately the squabbles of the Legislature prevented anything useful being done. In Indiana, the appropriation for the State Survey was increased and the salary of Mr. W. S. Blatchley, the State Geologist, was raised. In Colorado, a survey has been organized with the Professor of Geology in the State University in charge and a small appropriation has been voted. In Missouri and Iowa the appropriations were increased. The Constitutional Convention in Oklahoma has provided for a State Geologist. We take pleasure in recording these evidences of an increased interest in geological work, and we trust that these legislative acts indicate a vigorous maintenance of the State Surveys. The United States Geological Survey will not suffer from this; on the contrary, we believe that the local education of the public to the value of geological surveys will emphasize the usefulness of the Federal bureau and the advantage of co-operation between the geologists at Washington and those directing State work. One of the most important steps taken by the last Director, Mr. Charles D. Walcott, was to call the State Geologists together with a view to harmonious and co-operative investigation, and this far-sighted policy is likely to be fully furthered by his successor, Mr. George Otis Smith. On the whole, the outlook for systematic economic geology is excellent.

On Technical Writing.

A FEW WEEKS AGO we ventured to offer some criticisms on this subject, borrowing our examples of supposed error from the publications of the two leading mining societies. This seemed a step likely to make the discussion interesting and it was calculated to emphasize the importance of correct usage. To be frank, we had an eye to the humor of the position and hoped for a vigorous retort from the secretaries or editors of those societies. But as yet there is only an ominous silence. However, if the officials refuse to add to the gaiety of the nations, one member has undertaken to defend himself. It will be found in our last issue. Mr. C. S. Herzig is a sportsman; his retort is outspoken, and his defense effective. One point is especially well taken, and that is the explanation of the manner in which technical discussions are reported in England. This has always seemed a curious survival of custom. In the course of a discussion men make tentative suggestions and unimportant comments, such as are likely to seem trivial or even foolish when put into cold print. Thus Mr. Smith remarks that "if he remembers correctly, the specific gravity of quartz is 2.6" and Professor Brown assures the honorable gentleman that his surmise approximately correct; or Thompson refers to the production of a Mexican mine as being 50,000 dollars per day, whereupon Robinson asks whether the gentleman is talking in terms of American or Mexican currency, receiving the reply that the speaker is not sure which it is, but he will ask his informant the next time they lunch together. Something of this sort is allowed to get into the records, although such conversational matter ought to be excised and only information of permanent value preserved. Mr. Herzig's analysis of the use of 'very' is to the point, but it illustrates ours also. The occurrence he mentions is so rare as to warrant the use of 'very,' which would gain strength from an enforced rest. If Mr. Herzig and his friends will reserve 'very' for the rare occasions indicated by him, we shall achieve a restraint of language that will be satisfactory even to the hypercritical. As to the use of the impersonal 'one,' our correspondent hits us below the belt. We demur to the inference. One who is so clear in his views should not veil his identity under a mock-modest pronoun but come forth frankly under the egoistic first person singular. Speaking seriously, if we object to the use of the indefinite pronoun, it is because by much editing of vague writing it has been impressed upon us that it makes for confusion

and indefiniteness of statement. In his last paragraph Mr. Herzig makes a plea to which it is difficult to reply; if criticism is not acceptable, it will fail of its purpose. We had a distinct aim in bringing forward the subject of technical writing, believing that efficiency in one tool of the engineer is as desirable as in another, he ought to use his pen as intelligently as his slide-rule and be as systematic in his arrangement of words as in his design of a reduction plant. We do not despair of accomplishing some good. If our criticisms are just they will be effective; in any event, they will prompt more care in writing.

A Question of Practical Mining.

NEWS FROM MINING CAMPS often includes such a statement as "the Blank Company intends to sink to 1,000 feet depth before cross-cutting," or "the shaft of the So and So Syndicate has now reached a depth of 600 feet, and another hundred feet is to be completed before cross-cutting will begin." Both of these quotations are taken (except the names) verbatim from a daily paper. Statements of this kind are intended to be impressive, as indicating unusual vigor in exploratory work and suggesting tremendous possibilities when the cross-cuts finally reach the lode. To experienced miners the sinking of vertical shafts in new mining districts to cut veins of ore at a depth of several hundred feet will be rated at its full value. This idea of going out into the hanging-wall country of an unprospected lode and spending thousands of dollars on workings that finally intersect the line of the lode at one point, is contrary to the common sense that underlies all practical mining. There is always plenty of talk of the 'practical' as against the 'theoretical'; we venture to say that the most theoretical system of mining, and the one most completely divorced from practice, is this scheme of the promoter, who extends the time of glittering uncertainty and postpones the date of disillusionment by planning operations the main feature of which is that they give the minimum of evidence concerning the worth of the mine. We would like to see this topic discussed. Speaking from the standpoint of practical mining, we venture to say that the first thing a miner should do is to find a vein, then the valuable ore in that vein, then stick to the ore. In trying to ascertain the character of a lode in an undeveloped mine, and especially in a new district, it is best to follow the ore, even with an incline shaft. It is good mining to sink a winze on a new discovery, even in a well established mine, for while it is more costly to sink than to rise, it is best to find out something concerning the shape of the orebody before planning a raise or advancing a new level. When a young mine is being opened up, it is imperative to obtain information in regard to the persistence, size, and pitch of an ore-shoot; this is done best by following the ore, for such a method of working is productive, in the first place, and it is informing, in the second. Even if the miner cannot advance in ore, he will prefer to follow the vein where it is poor, rather than push his way into the outer country, where his work yields neither information nor results until it is consummated by reaching the vein. A real miner hates 'dead work,' and this aversion is well rooted in experience. The answer of the colonel or the broker that is probably responsible for the deep shafts mentioned at the outset of this discussion, will be that it is a mistake to waste money on 'gopher holes' and crooked inclines on the vein, when a vertical shaft sunk in first-rate fashion will afford the means to cut the ore at such a depth as to ensure large reserves. Of all the counting of chickens before they are hatched, there is none so mistaken as the estimation of ore in untried veins and the talk of reserves to be obtained by cutting a lode at one point. We appeal to the experienced mine managers for their opinion. It is an important matter, for we feel assured that much money is being wasted in blundering exploration, and that many mines are being spoilt by the vertical-shaft-deep-cross-cut scheme. It works this way: A company is organized to exploit a promising prospect, and a certain sum of money is raised to make a mine out of a hole in the ground. Instead of following the ore exposed at the outcrop, or cut in a prospector's trench, to determine how far it extends and how much expenditure in equipment it may justify, the management decides to start a shaft that is planned to cut the vein at a depth of several hundred feet. In the meanwhile the ore of the outcrop gives assurance that there is something there, and the pretentious scheme of operations tends to magnify the possibilities. Before the shaft, or the cross-cut from it, can reach the lode, a large amount of stock has been sold, the insiders have made a handsome profit, and most of the working capital has been spent. Should the cross-cut or shaft intersect the vein at a poor spot, as is likely, even in a good lode, the shareholders are needlessly discouraged. Sometimes so much money has been spent in taking this long shot, that no more remains; and the mine passes into other hands or into that of the insiders. Even if all is square and above-board, the shaft and cross-cut may be succeeded by a raise and by intermediate drifts before it is made plain that the vein has changed its dip between surface and 500 feet, or that the ore-shoot has a pitch different from that inferred at the grass-roots. It is because miners know something of the vagaries of ore occurrence that they take short views and prefer to go slowly in their explorations; only simpletons or spoofers plan adits to cross-cut creation at a great depth, or sink shafts to intercept ore-shoots of unknown character. It will be said that it is cheaper to hoist ore through a permanent vertical shaft than through a prospecting incline, and that it is better mining to extract ore through an adit than to raise it through a shaft. Yes, provided you have the ore. Get the evidence of the ore, its shape and its position, then go ahead and plan to extract it cheaply. The best mining is the cheapest mining, the cheapest is that which yields the maximum profit during the period of ownership, and to this we add the proviso that the profit is supposed to come from the economical treatment of the ore, and not from exploiting the simplicity of our fellow citizens.

Personal.

FRANK W. OLDFIELD has arrived at New York from Ecuador.

H. H. CLAUDET, of Claudet & Wynne, has returned to Rossland, B. C., from Mexico.

C. J. GARVIN is general manager for the Green Mountain Mining Co., near Silverton, Colorado.

N. P. WILSON, manager for El Porvenir Mining Co. at Parral, Mexico, has returned there from Denver.

EDWIN C. HOLDEN, of the firm of Hill, Holden & Irvine, is on his way from New York to Sonora, Mexico.

F. G. MCCANN is superintending systematic prospecting work near Rio Balsas, Guerrero, for an Arkansas company.

THOS. B. CROW, formerly of Prairie City, Oregon, is operating in the Argentine district near Montezuma, Colorado.

FRANCIS J. TAYMAN has been called from mining work in Mexico to St. Louis, on account of the illness of his father.

M. S. GRIFFITHS is expected in Mexico City after three months' examination of timber and mining claims in Guerrero.

FRANK ROBBINS, having finished a preliminary exploration of the nitre beds in southern California, has returned to Los Angeles.

NORVAL J. WELSH has resigned as superintendent of the Santa Brigida mine, in Chihuahua, Mexico, and is now at San Antonio, Texas.

FRANCIS A. THOMSON has been appointed professor of mining and metallurgy in the Washington State College, at Pullman, Washington.

H. MCCULLOUGH, formerly electrical engineer for the Toledo Mining & Power Co., of Sheridan, Mont., is now with the Pittsburgh & Montana Mining Co. at Butte.

E. L. WHITE, for a number of years at the head of the Bureau of Mines of Colorado, has opened an office at 222 Jackson Block, Denver, where he will conduct a general mining engineering business.

H. E. T. HAULTAIN, who for the past 18 months has been manager of the production end of the Canada Corundum Co. Ltd., has been appointed general manager with headquarters at Craigmont, Ontario.

HERBERT HAAS, having completed his work at Torreon, in Mexico, is visiting the smelters in Arizona, preparatory to resuming consulting practice in San Francisco. His office will be in the Flood Building.

OTTO E. FALCH, JR., recently chief engineer to the Pacific Coast Branch Otis Elevator Co., has opened offices at 850 and 852 Monadnock Bdg., San Francisco, to engage in consulting, electrical, and mechanical engineering.

L. VOGELSTEIN & Co., New York, give the following figures of German consumption of foreign copper for the months of January to March, 1907:

	Tons.
Imports of copper	26,506
Exports " "	2,113
Consumption	24,393
As against this same period in 1906 of	28,700

Of this amount 7,007 tons were imported from the United States.

General Mining News.

ALASKA.

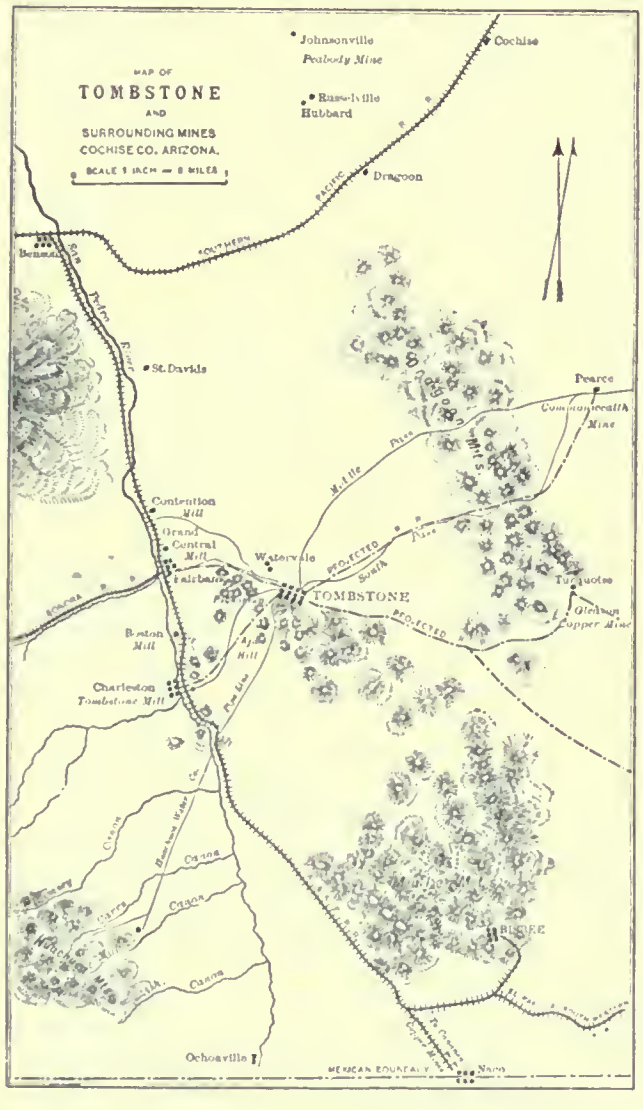
KETCHICAN.

B. D. Brown, president of the Brown-Alaska Co., owning and operating the Mamie mine at Hadley, and president of the Alaska S. & R. Co., owning and operating the smelter at Hadley, has sold his interests in both companies to G. D. Mumford, representing the balance of the stockholders in the two companies. The ore smelted at Hadley last year was valued at nearly $900,000.

ARIZONA.

COCHISE COUNTY.

The strike at Bisbee will no longer be handled by Bisbee Local No. 106, but will henceforth be in charge of the executive committee at Denver. This is in the nature of a retreat from the active field, and is looked upon as a victory for the operators.——The Ainsworth shaft at Paradise, now down 160 ft., will be sunk to a depth of 700 ft. It is thought that copper underlies the zinc-lead veins. The deepest shaft in the Paradise district at present is the Planet, on the San Simon property, which is down 455 ft. The 100-ton concentrator is still at work on the ground, treating the lead-zinc ore.——Two shifts are working on the Leadville.



GILA COUNTY.

While there are about 4,000 men employed at Globe, there is a scarcity of skilled labor, experienced miners and mechanics. The country is flooded with the poorest class of labor, and immigrants from southern Europe.——On No. 3 cross-cut on the fourteenth level of the Old Dominion mine, another body of sulphide ore has been encountered, after driving through about 50 ft. of barren vein-matter. Connection has been made by a drift from A shaft with B shaft and the mine workings on the tenth level, which improves the ventilation. A cross-cut will now be started from B shaft on the tenth level to explore Buffalo hill. Diamond-drill work from the bottom of C shaft, on the ninth level, developed a strong flow of water, and was discontinued. The drifts from A shaft on the ninth and tenth levels should reach C shaft by the end of June. These drifts will drain the wet ground and permit the sinking of C shaft to the twelfth level. The Old Dominion company has contracted for 30,000 tons of sulphide ore to be shipped from a mine in Madera county, California.——The failure to discover ore in the cross-cuts on the 500-ft. level of the Globe Consolidated may result in suspension of work in the cross-cuts. Efforts will be concentrated toward sinking the main shaft, and there will be no further cross-cutting until the 1,100-ft. level is reached. The shaft is about 725 ft. deep, and still in diorite.——The Arizona Commercial company continues to ship 200 tons per day to the Old Dominion, Douglas, and Cananea smelters. Regular development on the Copper Hill and Black Hawk mines is progressing.

PIMA COUNTY.

(Special Correspondence).—Information from Helvetia tells of a big strike of good ore. The Helvetia company has expended a large sum of money on its property and is just beginning to get returns. Its main shaft has reached a depth of more than 1,000 ft., and the strike just made seems to justify the extensive development work. The first level runs 75 ft. to the south in a low-grade sulphide of 4% copper; a cross-cut on this 15 ft. is yet in ore. The north drift of the first level is in 3,000 ft. The first part of it is in low-grade iron ore. Some days previous to the present strike an average sample of 200 ft. went 5% copper. The face of the drift runs 18%. There is a cross-cut about 60 ft. from the face running east which went through carbonate ore for 40 ft. and is now in high-grade sulphide. Near the face of this drift a cross-cut has been extended west for the purpose of sinking a winze for air. This cross-cut is in 12 ft. and the 12 ft. average 15%. The orebody at the first, or 100-ft. level is 60 ft. wide. At the 200-ft. level the cross-cut is in the ore for a distance of 15 ft. The ore is oxide with glance and native copper, and averages 19%. The orebody on this claim crops at surface and it can be traced for 2,000 ft. without a break or fault.

Phœnix, June 3.

YAVAPAI COUNTY.

A good strike has been made in the shaft of the New England-Arizona mine in the Big Bug district, at a depth of 220 ft. At that point sulphide ore was opened, carrying copper and gold. An air-compressor will be purchased and the shaft sunk with machine-drills. The property consists of six claims, lying four miles north of the McCabe-Gladstone mines, and three miles northwest of the Humboldt smelter.——T. H. Oxnam, who has charge of the Humboldt smelter for the Consolidated Arizona Smelting Co., announces that the plant will be increased in size, and a second 400-ton blast-furnace will be built at once. There are two reverberatories in operation, each with a capacity of 400 tons per day. The Humboldt plant gives employment to a large number of men.

CALIFORNIA.

EL DORADO COUNTY.

The shaft is being sunk on the Homestake mine which adjoins the Three Queens.——Men are working in the Eagle Bar mine, but the water is still pretty high.——Some rich ore has been found on the surface near the top of the old shaft at the Taylor mine.——Jay Lawyer, superintendent of the Vivian mine, has ordered the timbers for a 10-stamp mill, the machinery of which was moved from the Darling mine.

NEVADA COUNTY.

The hoist at the Niagara is ready for work. The vein is holding well and some especially good ore has been recently encountered. The company is building a new pipe-line, the intention being to operate the mill, pump, and hoist

with separate power. Water is obtained from the company's dam on Deer creek.——After a delay of 20 days, pumping operations have again been resumed at the Murchie mine. The water rose about 200 ft. in the mine during the period of inactivity and it will take 10 days to pump it out.——The James Brothers, who are developing a claim on the Mitchell ranch, will soon have their four-stamp mill running.——Berkeley men have bonded about six miles of Greenhorn creek, with the intention of dredging for gold, and also about 80 acres carrying the Blue Lead channel.——The Buckeye mine has been consolidated with the Cold Springs gravel mine. The Cold Springs has a bedrock tunnel in 1,500 ft., with 700 ft. of cross-cuts and raises. The equipment includes a 10-stamp mill for crushing cement gravel. The Buckeye has 2,500 ft. of development, 300 ft. being shaft work, and the remainder levels. ——The old Lincoln mine is being put into shape and should be a producer before long. A hoist will be erected and the shaft sunk 200 ft. deeper. H. H. Hicks is directing development.——J. S. Goodwin will build a 10-stamp mill on the Nevada claim at You Bet, which was once famous as a hydraulic camp. About 1,000 ft. of tunnel and drifts have been run. The gravel is hard and will have to be

California.—Showing Position of the Counties.

stamped.——It is thought that the Posey Canyon company has the lost Alta channel. The tunnel is being driven and the heavy ground, that gave so much trouble, has been passed.

PLACER COUNTY.

The last of the equipment for the Crater Hill mine has been received, including pumping and hoisting machinery. This mine was formerly known as the St. Patrick, and is situated between Auburn and Wheatland. It is being reopened by the Harmon people.—— The Taylor Foundry company has secured the contract for the construction of a complete 10-stamp mill for the Southern Cross mine, near Towle. This property has been opened by a tunnel. Electric power will be used to operate the plant.—— Operations at the Ophir are handicapped by lack of water, the supply being inadequate to run the Eclipse and Gold Blossom at the same time.——The new shaft, 300 ft. deep, has been completed at the Bellevue.—— The 200 and 400-ft. levels at the Gold Blossom are being opened. The company's books show that the last 23,000 tons of ore crushed averaged $8.18 per ton.—— Another 50 men were put on at the Hermam last week, and 50 more will be added soon.——At the Sailor Cañon mine, 10 men are employed.—— Promising ore has been found on the 1,100 and 1,200-ft. levels of the Three Stars.——Work will be resumed at the Crœsus mine, where the shaft is down 60 feet.

SAN BERNARDINO COUNTY.

The smelter of the Arizona-Mexican M. & S. Co., at Needles, is receiving lead ores from the Banner and Champion mines at Stockton Hill, in Mohave county, Arizona. Copper ore is coming from the Copper World mine, in this county, all of these properties belonging to the smelting company. The capacity of the smelter will soon be doubled.

SHASTA COUNTY.

(Special Correspondence).—The Shasta Copper Co. has acquired the Arizona group of claims, situated in the Lower Springs mining district, four miles west of Redding. The claims were formerly owned by the Bromide Mines Co. The Shasta company has also secured 30 claims, in the Stillwater district, between Redding and Bully Hill. The Arizona group has been developed to a slight extent, and the new owners will use diamond-drills to prospect the claims.——The ore-bunkers on the road from the Hornet mine to the Keswick smelter have been completed and the shipment of ore will soon commence.——The United States Gold Dredging Co. has ordered a $50,000 Du Bois suction dredge for its claims on the Sacramento.——At the Afterthought, good ore has been encountered in level No. 5. Several cross-cuts have been driven from the shaft to intersect the vein, and the mine is showing up well.—— About 700 men are on the payroll of the Mammoth Copper Co., and the railroad from the mine to the smelter is nearing completion.

Redding, May 30.

At the Summit mine, 14 men are employed. Electric motors and an air-compressor have recently been hauled into the property. The Stauffer Chemical Co. has a bond on the mine. Charles Kunze represents the company, and G. F. Graves is the superintendent.—— The Mammoth smelter, which closed down its furnaces for repairs and to connect the four new blowers, has been blown in again.

SIERRA COUNTY.

The Wisconsin mine, in the Alleghany district, has been visited by the directors of the company since the rich strike that was reported some time ago. The company owns several thousand feet of the North Fork channel which was worked some years ago at Forest, and it has prospected the ground with a tunnel and raises. F. T. Griffith is president of the company, and J. L. Liddell superintendent.

SISKIYOU COUNTY.

A large force of men has been hired at the Mono quartz mine, on Humbug creek. The mill will be run by electric power; new improvements have been made, and the cyanide vats overhauled.——The shaft on the Sheba claim on Patterson creek, in Scott valley, is down 500 ft. The mill will be started at once. The hoisting machinery and mill are operated by electricity supplied from the Fall Creek plant of the Siskiyou Electric Power Co. Noel E. Graves is the superintendent.——Some good ore has been found in the Granite mine, on Humbug creek. The ore is free-milling and shows some free gold.—— The Morrison Carlock company, in Quartz valley, has reduced its force to 20 men, while repairing the main shaft.

TUOLUMNE COUNTY.

A good shoot of ore has been uncovered in the deepest workings of the Big Casino G. M. Co.'s Mack mine, at a vertical depth of about 400 ft.——A vein has been cut in the west end of the Longfellow mine. The 20-stamp mill will be enlarged to 50 stamps. The compressor will be started as soon as the new motor arrives.—— Work will start at once on the 20-stamp mill for the Nonpareil, of which A. P. Dron is superintendent.

COLORADO.

BOULDER COUNTY.

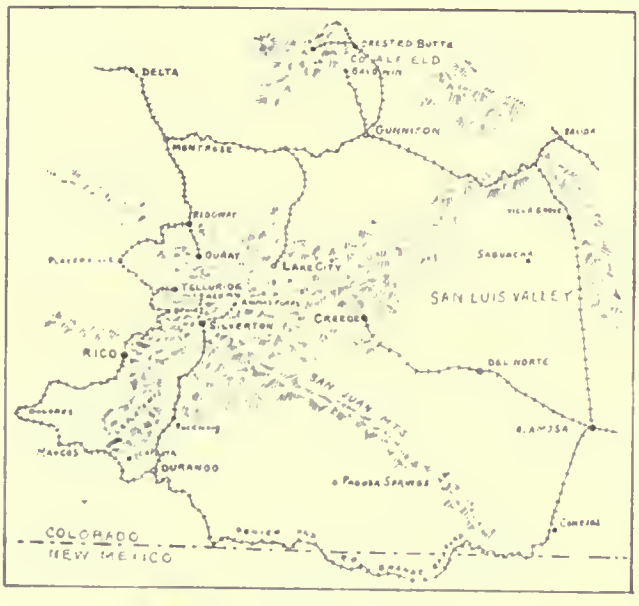
(Special Correspondence).—From reports received from different districts, Boulder county will undoubtedly show up well this coming year. Work is being done and new machinery installed. The big cyanide plant of Langridge &

Davidson in South Boulder cañon, near Crescent, on the line of the Moffat road, is completed, and is proving all that was anticipated. B. A. Langridge is general manager and Frank Lawrance superintendent.——A large amount of development work has been done on the Cash mine at Magnolia during the past four months. The cyanide mill, which will have a capacity of 30 tons per day, will be running in about 30 days. In the mine they have a streak carrying about one ounce gold. The development work, which they have been doing this winter, will give them about one year's work for the mill. The mine is equipped with Leyner compressor and Hardsoeg drills, and the shaft is 300 ft. deep. The mill is being equipped with agitators and amalgamating plates. S. B. Leonard is the manager.

Boulder, June 1.

GILPIN COUNTY.

Eighteen stamp-mills are said to be in operation in Gilpin county, their output during April amounting to $106,000. The bullion output of the county during the month was $146,000 gold. As another evidence of the activity of Gilpin county mines it is stated that there are 25



Map of Southwestern Colorado.

air-compressors at work in various parts of the county. The pneumatic-hammer drills are coming into more general favor, as they can be handled by one man. From the Gold Rock mine in the Russell district sample shipments are going forward, and the Hampton group is making progress in shaft and tunnel operations with a view to developing ore reserves. The draining of the various mines in this district effected by the Newhouse tunnel is already proving advantageous.

SAN JUAN COUNTY.

The Mogul mill is treating about 100 tons per day, which will be increased to 200 tons as soon as the new machinery is put in place.——The Gold King company is developing the shoot of gold ore that was struck at a depth of 800 ft. This ore runs high, and has been driven on for 50 ft.——The Detroit & Colorado company has let a contract for a new aerial tram to connect the upper workings of the property with the railroad. The tramline will be about 900 ft. long. The new compressor has been installed and 15 cars of ore were produced in May.——A good strike of silver-lead ore has been made in the Wallace vein of the Ruby Basin company. An orebody 150 ft. long and three feet wide has been developed during the winter.——An English company has been organized by Arthur Ponsford and George E. Collins, to take over the Polar Star, Mammoth, and 11 other claims on Engineer Mountain.

IDAHO.

IDAHO COUNTY.

Placer mining in the district around Elk City and Newsome, is assuming active proportions, and development work is progressing. Several of the large properties are being worked with success, and in all fifty claims are being actively prospected.——A 50-ton reduction plant is to be erected this summer on the Jim Green group of claims in the Big Creek district of central Idaho. The property is traversed by a gold-bearing vein which carries good ore, and an eight-foot vein containing antimony. W. A. Edwards, manager of the property, has gone to the mine, after a visit to Georgia, where he conferred with the owners.——John Bell has returned to Spokane from Pine Creek, Ida., where he inspected the Nabob mine, where there is a body of 18 in. of shipping ore. The drift was run on a stringer, which at the surface was eight inches wide and 170 ft. from the surface, widened to 16 in. Here a shaft was sunk for 60 ft. and at the foot of the shaft the vein is 18 in. wide. The vein is believed to be the same as the vein of the Crystalite claim, which is in the same group as the Nabob. Another shaft, 60 ft. north, has been sunk 20 ft., showing shipping ore. Besides these showings there are two main veins in the Nabob and Crystalite. The Crystalite is not being worked at the present, but men are at work in the Nabob vein, blocking out ore on the 80-ft. level. The main shaft has a depth of 380 ft., with levels of 80 ft., 300 ft., and the bottom. The level at 80 ft. is a surface tunnel. At the 300-ft. level there are two drifts 280 ft. long. On the lower tunnel the drift is about 450 ft. long. The water is being pumped from this shaft and is now down to 80 ft. below the first level. When the lower level is reached cross-cutting for the two veins will be begun. It is estimated that there is 100,000 tons of concentrating ore on the dump. The management expects to begin tunneling a half mile below the property on Stone creek. The tunnel will give 1,000 ft. of depth on the vein. On the Brooklyn group of claims the only work thus far done is a drift of 60 ft. The drift was run on a vein of ore a foot wide, which assayed 65% lead.

NEZ PERCE COUNTY.

John King, of Winchester, has made a strike of copper ore on Craig Mtn., in the Panhandle country. The rock was found four years ago by King while on a shooting trip. He discovered croppings containing copper and he and his son drove a 400-ft. cross-cut, which recently broke into a 30-ft. vein of ore which assays $47 per ton in copper, gold, and silver. The vein was then traced on the surface for 6,000 ft. After King and his son had located 12 claims they made the news of their find public. A wagon-road and a tramway will be constructed this summer so that shipments may be made.

SHOSHONE COUNTY.

Seattle capitalists, having an option on the control of the stock of the Evolution mine, near Osborn, in the Coeur d'Alene, have decided to install a compressor, erect a bunkhouse, and resume sinking in the old shaft.——A free-gold zone has been cut in the big vein on the Winnie property, near Murray. The width of the lode is not exposed, but it fills the whole breast of the drift. The Winnie, the property of Arastra Smith, has heretofore been considered a tungsten mine, the ore running more than $600 per ton in that mineral.——Four claims, the Anna, Anna No. 2, Last Chance, and Maple, near Osborn, have been bonded by George A. Bevin of Wallace, and D. C. Conrad of Saltese. Galena ore averaging $35 per ton was found in the upper workings several years ago.——Ralph B. Howard, of Spokane, has acquired a quarter interest in a group of five claims known as the Surprise, Center Lode, Maude S., Buckeye, and the Kentucky, on Osborn creek, south of Osborn. The purchase was made from B. E. Stevens of Wallace. The other interest is divided among S. R. Buell, W. M. Buell, W. H. Buell, and A. Pearley, of Osborn.——Machinery, including a compressor-plant and electric motors, has been ordered for the National mine, the bonanza silver-lead property on Snowstorm hill, near Mullan. The total expense will exceed $10,000.——Harry L. Day has made the first payment on the bond of $150,000 for the Custer mine, on Nine Mile creek in the Coeur d'Alene, where development work is pushed in the lower tunnel. The mine produced 121,000 lb lead and 4,500 oz. silver last year.

MONTANA.

CHOUTEAU COUNTY.

A rush is expected this summer to the Bear Paws portion of the Chinook copper district. There is a good showing on the property of the Copper Gulch Mining Company.

GRANITE COUNTY.

Good silver ore has been struck on the northern slope of Red hill, about two miles from Philipsburg. The Hope mine in this district has produced some rich ore of this sort in limestone.——Work has been started on the Mountain Rain group, in the Antelope district, owned by C. W. Davis and associates, of Colorado Springs. A cyanide mill with a capacity of 100 tons per day has been ordered.——Good progress is being made on the Hercules property of the Barnes Copper Co., on Gird creek.——Lawrence Donlan of Tower has sold the San Francisco property to parties connected with the A. S. & R. Co. There are large quantities of low-grade ore developed.——The Trout mine, operated by James Patten, is making regular shipments to the smelters. ——A survey will be made for a pipe-line from Granite to the mill of Bi-Metallic company. This probably means that the mill and mine will start work again.

NEVADA.

CHURCHILL COUNTY.

(Special Correspondence).—A strike has been made in the Nevada Wonder, where a new vein parallel to the main lode has been found. This strike is the second that has been made in the last few weeks.——The shaft of the Monnette Wonder is being sunk to a depth of 158 feet, where the management hopes to strike the vein system of the Nevada Wonder. A large force of men is employed at the mine.—— At the Daisy Wonder the shaft is being sunk to a depth of 100 ft. in order to tap the orebody supposed to be at that point. A small stringer of good ore was encountered at a depth of 50 ft. A 25-h.p. hoist has been installed.——The rush to the new camp of Gold Creek has drawn away many miners from here, with the result that many of the mines are working short-handed.——Water is scarce and living high here, and it is difficult to retain miners.

Wonder, May 25.

HUMBOLDT COUNTY.

(Special Correspondence.)—An 18-in. vein of quartz has been encountered in the shaft of the Fairview mine at a depth of 225 ft. The shaft is now down 250 ft. and will be sunk an additional 100 ft. When this depth is reached a cross-cut will be driven to intersect the vein showing at the surface and the new 18-in. shoot. The mine is owned by the Seven Troughs M. Co.——A shaft and tunnel are opening up the Mazuma Hills mine. The mine is said to contain a rich two-foot vein, but the directors will not allow anyone not connected with the company to enter the mine. ——In the Kindergarten, some ore running well is being extracted and the mine is being worked at depth.——Vernon is reached by way of Lovelocks, on the S. P. railroad, and is only a few hours' ride from Salt Lake City. The town is well supplied with water and has about 300 inhabitants.

Vernon, June 1.

LINCOLN COUNTY.

(Special Correspondence).—Continued prospecting in the vicinity of the Potosi mine shows increasing bodies of zinc ore, and those directly interested in zinc are paying attention to that locality, which embraces a wide area. The ores show as high as 20%, and even 50% zinc. The Potosi continues to ship 35 to 40 tons per day; machinery has been ordered, and the output will be increased. This mine has shipped 9,000 tons, while the ore developed is estimated at 140,000 tons. Shipments thus far average 37% zinc. A prospecting shaft sunk from the tunnel level, 100 ft. deep, shows ore in the bottom.—— The Alpine Plaster company has broken ground 12 miles south of Las Vegas, on the Salt Lake railroad, for its buildings, and is surveying a four-mile industrial railway line to its gypsum quarries.——The Lucky Strike shaft is 105 ft. deep, and drifts are being run from the bottom of the shaft. The car shipped returned 77% lead, and another car will be shipped soon.—— The Vegas Artesian Water Syndicate's first well, three miles northwest of Las Vegas, has flowing water, it being encountered at 30 ft., and at 174 ft. it flowed out of the top of the casing.

Las Vegas, June 1.

(Special Correspondence).—The Golden Crescent company is developing the Opal vein on the Syndicate claim, and in the workings have opened up two feet of rock running $8 per ton.——Two feet of ore has been opened on the Jumbo claim of the Searchlight Gold Extraction Co., and the find is being explored.——Three feet of ore has been opened on the 200-ft. level of the Ajax Bullfrog, and R. H. B. Warburton, the superintendent, is engaged in driving a 150-ft. drift to open up the vein. In the development on the Nevada Crescent, some ore has been discovered that will run $200 per ton.

Crescent, June 1.

NYE COUNTY.

(Special Correspondence). — The annual report of the Tonopah for the year ending February 8, 1907, shows that the production amounted to $473,492, a net earning of $316,971; 16,458 tons of ore, at about $30 per ton, was produced and shipped to the smelters. During the period the company paid three 10% dividends.——During the week ending May 23, the following amount of ore was shipped from Tonopah: From Tonopah M. Co., 4,000 tons; Belmont, 400; Tonopah Ex., 220; Montana, 145; Jim Butler, 41 tons; and Midway, 40 tons.——A rich shoot of ore was recently found on the 400-ft. level of the Tonopah Extension. In places the vein is 42 ft. wide.——A cross-cut driven from the 400 level of the West End Consolidated shaft, shows the lode to be 112 ft. wide. The vein lies between well defined walls.——The work of developing the orebodies at the Jim Butler steadily progresses, and some excellent ore was recently encountered.

Tonopah, May 25.

WHITE PINE COUNTY.

(Special Correspondence).—Owing to the non-arrival of steel and heavy timbers for the plant, the first unit of the Steptoe smelter will not be in operation before the early spring of 1908. Delayed shipments of machinery are slowly coming in, but the congested condition of the railroad supplying this camp is tending to greatly hinder its progress. ——The shaft at the Steptoe Con. is down 40 ft. and has reached a vein of copper four feet wide. A bunk and boarding house has been erected, and the work of developing the vein will be pushed.——A 4 by 8-ft. working shaft is being sunk on the Copper Queen, and some good ore, containing copper carbonate and silver, has been encountered. The main vein has been traced for 4,800 ft., and in places is 60 ft. wide.——Alfred Fletcher, of Leeds, England, and J. W. Walker, of Cherry Creek, have purchased The Chief of the Hills mine, in the Cherry Creek district, from F. M. McDermid for $40,000. The new owners will sink a double-compartment shaft 700 ft. deep, and will immediately install a 40-h.p. hoist. The property contains gold, silver, and lead.——Utah capitalists have acquired the Champion group from George W. Dale, of Los Angeles, for $20,000 and are making arrangements to put a force of men at work to open up the property. Two 100-ft. tunnels and a 70-ft. shaft have opened up a vein which carries a little lead, silver, gold, and copper.——Some excellent ore has been uncovered in the Ely Witch, and the management is preparing to increase the working force.——One of the richest strikes ever made in this district is reported by the management of the Ely Central. Ore running 15% copper was struck in the 440-ft. level, and the vein is of fair size.—— Developments are rapidly progressing at the Ely Consolidated property and immense quantities of ore are being blocked out. A large force of men is employed at the property and large areas of territory are being explored with churn drills.——The new gasoline hoist at the Robinson is in position and the 75-ft. shaft will be sunk. Some good ore has been uncovered.——Superintendent Clark of the Blaine mine, in the Granite district, 35 miles north of here, reports that the tunnel that is being driven to tap the orebody recently opened up by the 260-ft. shaft is in good ore, although it is 150 ft. from the point desired.——A good strike has been made in the Copper Jack claim at Mizpah,

the ore running over $100 in gold and copper. The shaft on the Jumbo has not yet cut the vein, but indications for an orebody are good.——The Independence mine has been bonded by Colorado capitalists for $15,000. The bonders expect to develop the mine during the summer.

Ely, June 1.

WASHINGTON.

FERRY COUNTY.

(Special Correspondence). — The Oversight Mining & Milling Co. has put a pump in the Pin-money shaft and resumed sinking. Two new strikes of pay-ore have been made on the Oversight claim.——At the Winnipeg mine the compressor-plant has been installed, and power-drills will be in operation some time this week.——A body of ore 40 ft. wide has been cross-cut from the head of a raise 40 ft. above the No. 2 adit. The ore is iron sulphide, but no information is obtainable regarding its value, except that it is good enough to ship. The company will increase its working force, cross-cut from the No. 2 adit, and get ready to stope ore for shipment.——Nearly four years ago the Lucile Dreyfus Mining Co. got into difficulties, through forgeries and fraudulent issues of stock by Eugene A. Kressley, its former secretary, who served a term in the penitentiary. The mine, at Danville, was immediately closed. All difficulties have been adjusted, and men are putting the mine in shape to resume operations. The company expects soon to be shipping. The vein is 100 ft. wide, and from 25 to 30 ft. of iron sulphide, carrying gold and copper, has been intersected on the adit-level. A winze is down 100 ft., and a cross-cut from the bottom is about 25 ft. long and all in ore.——The British Columbia Copper Co., owning the Lone Star and Washington claims, contiguous to the international boundary line, about two miles northward from Danville, is getting that property on a paying basis. From 200 to 300 tons of pay-ore have been mined near the surface, east of the old shaft, which was sunk 300 ft. New ore-bins have been constructed, and the company is preparing for steady shipments to its smelter, at Greenwood, B. C.——An adit has been driven 860 ft. on the Advance mine, near Covata, in which a silver-lead vein, seven feet wide, has been encountered, at a depth of about 400 ft. The ore will yield rich concentrate.——A blind vein was encountered in the lower adit of the Gwin mine, about 200 ft. deep and a little over 200 ft. from the portal. It is 10 ft. wide between the walls and is well mineralized throughout. A three-foot streak on the foot-wall has the appearance of being rich in copper and gold. The main vein was cut at about 125 ft. farther into the hill and has proved to be 20 ft. wide. The ore assays 9% copper, in addition to $\frac{1}{10}$ oz. gold and 41 oz. silver per ton. The adit gives a depth of nearly 500 ft. on the vein.——At Meteor camp the Keystone is producing unusually good ore. New ore-bins have been completed at the Meteor mine, and the company will start shipping to the smelters.——Two shifts are driving a new adit on the Nonpariel mine, which has been extensively worked and is now in shape to produce shipping ore.——The new management has received $80 per ton from ore lately shipped from the Stray Dog mine to the Everett smelter. The returns are net, after paying for a long wagon-haul, railway transportation, and treatment. The orebody is 14 ft. wide, and the place of production is 300 ft. deep.——A contract for 300 ft. of an adit on the Silver Crown mine has been finished, and the face is entirely in ore which contains silver and copper, but no assays have been reported. This property is situated in the Nespelem district, near Keller camp.—— The Colorado mine, in the same district, is about to be reopened. A vein was cut in an adit about 200 ft. from the portal which assayed $\frac{1}{4}$ oz. gold and 140 oz. silver per ton.——An Eastern company has purchased the Gold Seal mine, on Bridge creek, and has commenced operations under the management of S. L. Boyer.

Republic, June 1.

KLONDIKE.

The Klondike country proper—that is, that portion of the Yukon Territory in the vicinity of Dawson, as far as the individual miner is concerned, is on a rapid decline, owing to the immense area of ground being acquired by dredging companies. One company alone has purchased nearly all of the placer ground on the three principal creeks, namely, Bonanza, Eldorado, and Hunker, and has bonded considerably more on Dominion and other creeks. This has practically depopulated these creeks for various reasons. Where formerly hundreds of miners were working for wages or working their own ground, thus creating a demand for provisions, clothing, machinery, hardware, etc., and the transportation from Dawson to the different mining operations, now dredges are either operating or in course of construction.——An electrical dredge, capable of handling 3,000 cu. yd. of earth per day of 24 hours, will only require about 13 men to handle, at an approximate cost for labor of $100 per day. While this difference is not as yet felt by the laboring man in the Territory owing to the great amount of preparatory work under way by the different dredging companies, and the construction of a railroad from Dawson to the various creeks, eventually it will make a difference in the amount of labor required. The present scale of wages for laboring men is $4 per day and board, and from $5 to $7 and board for skilled mechanics, the board costing the companies $2 per day. These are the wages paid by the large companies, but the wages around Dawson are probably a little higher.—— This new method of mining, while it affects the individual placer mining in the Klondike district, has a tendency to cause the prospector and miner to look for new fields, both in the Yukon Territory and Alaska. It gives the small mine owner an opportunity of obtaining a fair price for a piece of ground which would hardly pay him to work by the old method of wood fire or steam thawing; and were it possible for him to work it by improved methods, his property is not of sufficient size to pay him to do this. It has also caused great activity in the locating of all ground open for staking in this vicinity that has not been heretofore thought of sufficient value to work, the locator only doing enough work to keep it represented until he has an opportunity to unload on one of the large companies. In this way entire creeks have been staked during the past two years.

The total amount of gold exported from the Yukon Territory during the year ended Dec. 31, 1906, according to the records, was $5,230,600, of which $33,540 was from Alaska, the balance being the product of the Yukon Territory. The records of the Alaska Pacific Express Co., at Dawson, show that $5,930,670 worth of gold was received by that company from points in Alaska, principally the Tanana district, for shipment to the United States. This makes the amount of gold shipped from Dawson to the United States in 1906 as follows: Canadian gold invoiced at the consulate, $5,287,067; American gold invoiced at the consulate, $33,539; American gold in transit for the United States, $5,930,672. Total, $11,251,278.

MEXICO.

JALISCO.

The Real Alto Mining Co. has been organized in Philadelphia with a capital of $1,000,000, to take over the Santiago, Las Cruces, Obscuriana, Castellena, and Peña Rejada mines in the Real Alto camp. Joseph Esherick Jr. is president, and J. R. Gillam treasurer. The properties are *antiguas;* a 2,280-ft. cross-cut tunnel will be driven.—— William H. Lees, the manager for the Cuartas Mining Co., reports that the Cuartas vein has been cut in the company's property in the Bautista camp. The vein was found in running a cross-cut from a winze in an old tunnel several hundred feet below the surface.——A good ore-shoot has been opened in the San Jorge mine of the Santa Lucia Mining Co., in the Navidad district. The main tunnel is in 900 ft., and cut the Descubridora vein at a distance of 776 feet.

SONORA.

The prediction is being made among mining men that the copper production of Mexico will be doubled during the next twelve months. The rapid development of new and rich copper properties in the northern portion of the Republic is the chief foundation for this view. In Sonora and Sinaloa new copper reduction works are being installed; and marked activity is apparent throughout the Arizona-Sonora belt.

Special Correspondence.

London.

Wolfram.—The Chastan Syndicate.—Royal School of Mines.—Gold Mining in Tasmania.—General Botha and Chinese Labor.—Spassky Copper. — Account of Progress. — Other Siberian Mining.

Wolfram, once regarded as of little value, has gradually come into prominence, and today several Cornish mines are obtaining between £150 to £180 per ton for this product. The total production of wolfram in the United Kingdom from 1877 to 1881 was only 94 tons, sold for £922. Cornwall sold 167 tons for £11,055 in 1905. The output last year was greater still, and this year promises to eclipse all others. East Pool and South Crofty are among the prineipal producers.

Mining speculators are reminded that the striking of the English gold 'reef' promised by the Chastan Syndicate is now about due. A good deal of interest is said to be taken in the matter in South Africa owing to the fact that Mr. Lennon, an ex-Government geologist of the Transvaal, made his Forest of Dean discovery during a holiday stay there. Returning to South Africa, he was captured by the Boers during the war and since his release he has spent six years tracing the Forest of Dean reef. Then he imparted his secret to a favored few, and, according to the story, a Rand mining expert, engaged by one of the best known South African houses, reported that the ore was of a true 'banket' or conglomerate character similar to the Rand ore, and that the property offered prospects of "a fair mining venture."

At the annual dinner of the members of the Institution of Mining & Metallurgy, held on May 3, Professor W. Gowland (the president) presided. The Rt. Hon. Reginald McKenna (President of the Board of Education), in proposing the toast of the evening, said he was particularly happy in assuring the assembly that the New Imperial College of Science and Technology was on the verge of foundation. He hoped in the course of the very next week it would be his duty to petition His Majesty for a charter for the new college. In this connection he wished to mention with sincere thanks the names of Hennen Jennings and Walter McDermott, who served upon the departmental committee, with Mr. Moreing and others, who gave most valuable evidence before that committee, and last, but not least, the name of their chairman that evening, whose evidence was of supreme importance. The Royal School of Mines, which had created for itself a reputation extending the whole world over, would be affiliated with the new Imperial College, and all who were interested in the special object of technical instruction in mining and metallurgy knew that the very best equipment which the world could produce was needed for their School of Mines. The president, in replying to Mr. McKenna, said it had been the aim of the Institution of Mining & Metallurgy whenever possible, to do what they could in aid of the Royal School of Mines, so that it might be worthy of the important position of mining and metallurgy in the great British Empire.

Some very fine developments are reported by the superintendent of the Tasmania Gold Mining Co. At the 1,100-ft. level east the width of the lode is 10 ft., and its value 1 oz. 12 dwt., and in two raises above this level the lode is respectively 8½ ft. wide, assaying 1 oz. 19 dwt. and 4 ft. wide assaying 15 dwt., while in the 1,100-ft. level west the width of the lode is 4½ ft., and its assay value 6¼ dwt., and in a raise above this level the lode is 8½ ft. wide, assaying 2 oz. 6 dwt. This mine is at Beaconsfield, near Launceston, in northern Tasmania.

A financial correspondent expresses the opinion that General Botha has very quickly caught the knack of expressing himself in terms of pleasantly vague sympathy, which is so great a part of the equipment of the skilled diplomat. He has acquitted himself with conspicuous success, having left a good impression in the home country without offending the tender susceptibilities of any of his compatriots in the Transvaal. Practically, there is nothing to be learned from the answer he made to the conference of mine owners; but, generally, his remarks convey the idea that he is not going to be led into any foolishness with regard to Chinese labor—one way or another. At any rate, the market seems to have been fairly satisfied with his statement.

Some progress is to be noted in the Rhodesian gold output. For the month of April the total of 49,772 oz. is

2,885 oz. above that for March and 6,749 oz. higher than April of last year. It has only once previously been surpassed—in August last, when the total was 50,127 oz.; but the past month's daily average is the best yet made, the 1,659 oz. comparing with 1,617 oz. in August, or 42 oz. more per diem.

Public interest has considerably waned in Spassky Copper. A year ago the shares were eagerly bought on the market at double today's price of £3 10s. No lack of confidence in the future of the property is, however, shown by the executive in London. The second annual report for the year ended September 30, 1906, states that the smelting operations have resulted in a working profit in Siberia of £30,962. Having regard to the fact that until the new plant is completed, smelting operations and the profits arising therefrom cannot be looked upon otherwise than as transitional, the directors are of the opinion that these preliminary profits should, in the same way as last year, be employed in writing off initial expenditure pertaining to the formation of the company and development of the mines. Since the date of the balance sheet a further sum of £62,500 has been received in respect of the issue of the remaiuing 25,000 shares, and the authorized capital of £300,000 is therefore now entirely issued. The company has been authorized by the Czar to operate in its own name in the Russian

Empire. The properties that have been held in the uame of the vice-chairman of the company are now being transferred into the name of the company itself. The directors indicated last year that they had decided to erect new works capable of producing upward of 300 tons of copper per month, and, simultaneously, to construct a railway from the Karagandy coal mines to the smelters, aud to re-eqnip the Yuspenssky and Karagandy mines. The erection of the works was actively continued during the summer, but building operations were, necessarily, suspended during the winter months. They were, however, recommenced on April 13, and the completion of the works is expected toward the end of the present summer. The amount of copper smelted during the year has been governed by the amount of transport available, which, in turn, has been affected by the demand for transport created by the new construction and railway works. Although the aggregate of transport was considerably greater last year than the previous year, the major part of it was necessarily diverted from the cartage of coal and ore to the transport of machinery and material, and smelting suffered proportionately. Production was, however, maintained until the new construction works were begun, after which smelting proceeded irregularly and at intervals. In all, 814 tons of copper were produced by the old smelters, realizing £88,677, an average of £108 18s. 9d. per ton. The copper was over 99.5 per cent.

In other parts of the Czar's dominions gold-dredging continues to excite a certain amount of interest. It is rumored that C. W. Purington, whose experience in Alaska, Oroville, and other gold-placer districts is well known to readers of the MINING AND SCIENTIFIC PRESS, is about to proceed to Eastern Siberia under the auspices of The Russian Mining Corporation, Ltd. Mr. Purington is to head an expeditionary party charged with the examination of extensive gold-bearing gravel properties on the Tumine and Koltchan rivers.

Salt Lake, Utah.

New Companies Organized.—Shipments From Tintic.—Utah Copper Co.—Honorine Mining Co.—Local Business.—Newhouse Corporation.

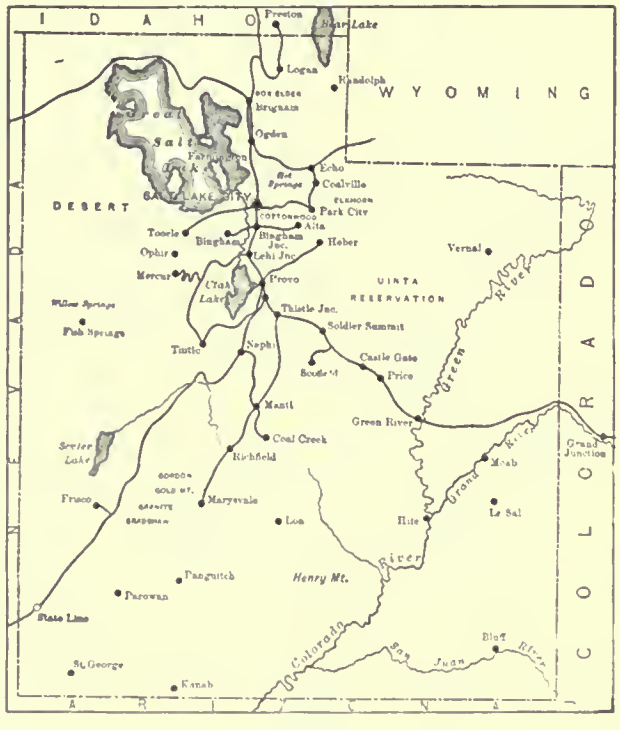
The Lakeside Copper Co., operating on Promontory Point, west of Ogden, has begun prospecting by means of churn-drills.—— A leasing company has been organized at American Fork to operate the Sunday mine, from which lead-silver ore has been shipped in the past.—— The old Lincoln mine in Beaver county is to be operated again, it having been recently taken over by a syndicate of Denver capitalists. The Lincoln group contains the first mining claim patented in Utah.

The ore shipments from the Tintic district last week amounted to 130 carloads, the contributing mines and respective amounts being: Ajax, 2; Bullion Beck, 9; Beck Tunnel, 12; Carisa, 6; Colorado, 10; Centennial Eureka, 42; DePue, 6; Eagle & Blue Bell, 4; Eureka Hill, 2; Grand Central, 2; Lower Mammoth, 7; Godiva (concentrate), 7; Scranton, 6; Swansea, 1; Uncle Sam, 8; Yankee Con., 5; Victoria, 2 carloads.

An Eastern syndicate is negotiating for the purchase of the property of the Jennie Mining Co., in the Gold Springs district of Iron county. This mine was recently equipped with a mill, which is now treating 40 tons of ore per day.—— Articles of incorporation of the Iron King Consolidated Mining Co., which will operate in the Tintic district, have been filed. The officers are: C. E. Loose, president; Reed Smoot, vice-president; J. T. Farer, secretary. The headquarters of the company will be at Provo.

A statement from the management of the Utah Copper Co., is to the effect that 800 tons of ore was treated daily at the Copperton mill in lower Bingham cañon during the month of May. It is expected that the average will be nearer 1,000 tons during the present month. A portion of the first unit of the new Garfield plant is in operation and the management hopes to have this entire unit in operation by the 10th inst.——The minority shareholders of the Honorine Mining Co., of Stockton, who entered a protest against the action of the directors in levying an assessment of 20 cents per share, after making a thorough investigation of the company's affairs, have reached the conclusion that the members of the board took the best means toward liquidating the present indebtedness of the corporation, which amounts to approximately $300,000. The pending assessment, if paid, will bring $100,000 into the treasury of the company. During the past ten months the mine yielded 54,000 tons of ore, from which was realized $68,000.

The Markham Gulch Milling Co. has its new Bingham concentrator in successful operation; the first run being made on a 6,000-ton lot of ore from the Utah Apex mine. It is expected that steps will be taken toward the enlargement of the Garfield smelter of the A. S. & R. Co., before the close of the present year. Preparations for the starting of the initial unit of the Utah Copper Co.'s new mill at Garfield are about completed. It is planned to have some of the equipment running on ore during the first week in June.



Utah.

A statement from the management of the Utah Copper Co., is to the effect that 800 tons of ore was treated daily at the Copperton mill in lower Bingham cañon during the month of May. It is expected that the average will be nearer 1,000 tons during the present month. A portion of the first unit of the new Garfield plant is in operation and the management hopes to have this entire unit in operation by the 10th inst.——The minority shareholders of the Honorine Mining Co., of Stockton, who entered a protest against the action of the directors in levying an assessment of 20 cents per share, after making a thorough investigation of the company's affairs, have reached the conclusion that the members of the board took the best means toward liquidating the present indebtedness of the corporation, which amounts to approximately $300,000. The pending assessment, if paid, will bring $100,000 into the treasury of the company. During the past ten months the mine yielded 54,000 tons of ore, from which was realized $68,000.

The Markham Gulch Milling Co. has its new Bingham concentrator in successful operation; the first run being made on a 6,000-ton lot of ore from the Utah Apex mine. It is expected that steps will be taken toward the enlargement of the Garfield smelter of the A. S. & R. Co., before the close of the present year. Preparations for the starting of the initial unit of the Utah Copper Co.'s new mill at Garfield are about completed. It is planned to have some of the equipment running on ore during the first week in June.

Samuel Newhouse has made the announcement that his corporation will be on a dividend-paying basis in July and it is gratifying to note that the payment will equal not less than 20% on the company's capital, or $1,200,000. Two such payments annually would amount to $4 per share. The May earnings of the Newhouse corporation will be close to $200,000. New equipment is being installed in the mill, which will bring the capacity up to 1,200 tons per day.

John Weir, the president of the Utah Nevada Mines & Smelters Corporation has made a statement to the effect that since paying for the Pioche properties, the company has a cash balance approximating $150,000 and 120,000 unissued shares out of a total capitalization of 1,500,000 shares.

A suit brought by Jesse W. Fox of Salt Lake against the Beck Tunnel Consolidated Mining Co. has resulted in a verdict for $240 in favor of the plaintiff, who sued to recover 4,000 shares of stock and $1,260 in dividends. The judgment is for the value of the stock sold at a delinquent sale in 1905.

The ore and bullion settlements reported by Salt Lake banks last week aggregated $358,000.

Denver, Colorado.

Zinc Production Increasing.—Magnetic Separation.—Graduates From Mining Schools.—How Mining Engineers are Made.

The mineral complexion of a State changes no less from year to year than does its political complexion. Colorado is developing into one of the great producers of zinc. It is only a few years now since the plant of the United States Zinc Co. was established at Pueblo, but already it has been enlarged to one-third greater capacity, and an additional furnace of 240 retorts, adding another one-third, is in process of construction. The great problem with the zinc ores of Colorado is to free them from the iron, copper, and lead sulphides with which they are associated. It is impossible to treat the ores for zinc unless these have been almost completely removed, as about two tons of fuel are required to treat one ton of zinc ore. In consequence, the ore must be high in zinc to enable the reduction of the ore to be done profitably. The separation from the galena is an easy matter, as the two minerals differ widely enough in specific gravity to enable them to be readily separated by ore-dressing processes. But to free zinc-blende from pyrite and chalcopyrite is not so easy a matter. The method by which it is usually performed is to subject the ore to a light roast, just enough to make the pyrite slightly magnetic. The ore is then passed through magnetic separators, the non-magnetic product containing the zinc. But this is attended with a difficulty. The ore as charged to the roasters is moist. By contact action the resultant fumes contain an appreciable amount of sulphuric acid that manifests its presence by killing the surrounding vegetation in the summer months. Consequently, in order to avoid damage suits, it is necessary to employ some process that makes this preliminary roasting unnecessary. This is attained by using a different type of magnetic separator, by means of which the zinc is removed directly, without any preliminary roast. Thus the farmer is satisfied, and the reduction of zinc ore is enabled to proceed. With the increasing number of mills to dress the complex ores of the San Juan, and the growing output of Leadville, the production of zinc seems likely to gain in importance.

This is the time of year when the newly fledged mining graduate issues forth from our technical schools, to make application of the theoretical and practical knowledge he has gained, and to win renown and fortune, if he may. Colorado contributes, as by right she should, her share to the total: Thirty-five young men have just taken their degrees in mining and metallurgy at the State School of Mines at Golden, and two at Colorado College, at Colorado Springs, where a department of mining and metallurgy has recently been established. It is now no longer necessary to argue the value of a technical education. No young man can pass through a technical course without deriving great benefit from it. But many young men do not derive as much benefit as they ought, for the reason that it is not until after they have graduated that they come to see clearly what was the real import and purpose of their technical training. Especially is this true of the young man who has had no previous experience in mining. He usually labors under the delusion that he has gone to his technical school to learn mining, and that when he graduates he will be perfectly capable of assuming the direction of important enterprises. The real truth is that he has gone to the technical school to learn *to study* mining, and if he could only appreciate this important fact at the beginning of his course he would be correspondingly the gainer. No mining school entertains the belief that it makes mining engineers; its sole duty and purpose is to familiarize the student, as far as it is practicable, with what has been learned by others concerning his profession, to give him practice in accurate methods of experimentation, to train him to accuracy of observation and logical methods of thinking, and then send him out to make himself, as quickly as his measure of ability will permit, a mining engineer. This important fact few mining graduates realize upon graduation, and as a result they take themselves too seriously. But, like the puppy that chews the soap and his master's shoes, until he comes to realize that soap and shoes are not just what he took them to be, the mining graduate generally comes quickly to know that experience is acquired in no other way than by going out and getting it; it is not to be purchased at the second-hand store. Then he has his "second wind," and is ready to begin to take his place in the ranks of the mining engineers and metallurgists.

Cripple Creek, Colorado.

Successful Leases.—State Officials as Mine Operators.—Decision in Portland v. Independence Suit.

The Western Investment Co., operating the Specimen claim of the Stratton estate on the south slope of Bull hill, is shipping from two to three cars of ore per week. Small high-grade streaks are being mined on the third level north of the shaft. Development is being done south of the shaft on the sixth level, where a 6-in. streak is being followed, but at present the vein is not of sufficient grade to pay for shipment. The same leasing company is also driving at a depth of 800 ft. east and west of the Orpha May shaft for the extension of the Lucky Guss veins.

An option has been obtained by E. Lyman White, formerly State Commissioner of Mines, John M. Maxwell, Judge of the State Supreme Court, and Prof. Flick of the Colorado State School of Mines, on the Mary Cashen mine in Victor. The property has, until lately, been operated under lease by the Arequa Gold Mines Co., which has done considerable development on the lower levels. The control of this company was bought by the above-mentioned parties from Eastern capitalists. At a depth of 800 ft. the level has been driven north from the shaft toward the Granite property to encounter, if possible, the rich orebody that produced in the neighborhood of $30,000 on the 700-ft. level.——A strike has recently been made on the Lottie claim on the west slope of Bull hill. J. A. Beckman and H. G. Moore are operating a lease on block 231 of the Stratton estate, which comprises a portion of the above claim, and while trenching they uncovered a vein at a depth of 15 ft. showing rusty gold in many places. One sample gave returns of $300 per ton. The find is only 75 ft. from a a shaft through which operations will be conducted. A small shipment of the higher grade ore is to be made.

At the termination of two weeks' strenuous legal fighting in the United States District Court at Denver the case of the Portland Gold Mining Co. r. Stratton's Independence, Ltd., has come to an end with a verdict in favor of the defendant company. Judge Lewis ruled that the attorneys for the Portland company had brought their case in trespass, but had failed to prove it by the

evidence presented. The suit was for approximately $150,000 for ore alleged to have been taken by the defendant company and its lessees from Portland territory. Dorsey & Hodges of Denver are attorneys for the defendants and Tyson S. Dines for the plaintiff.

Butte, Montana.

Production of Copper.—Increase During May.—Company Suspends Work.—Afro-American Enterprise.—Pittsburgh & Montana.—Tuolumne Copper Co.—British-Butte Company.

The copper production of the Butte district in May amounted to 29,019,550 lb., about 1,500,000 lb. more than in April. Out of the total the Washoe smelter produced about 18,000,000 lb. in May. The yield of copper per ton of ore has been much reduced while the tonnage has been increased. The Anaconda, Butte & Boston, Parrot, and Trenton mines are hoisting comparatively little first-class ore. The high-grade ore in nearly all of the Amalgamated mines is being blocked out and held in reserve against the time when copper prices drop and it becomes less profitable to mine the low-grade stuff. A great deal of ore that runs below 3% copper is mined, much of it running 2½% and even lower. At the present prices of copper this ore can be mined at a profit. The following table gives details of the output in May:

Company.	Tons of ore.	Pounds per ton.	Total pounds.
Boston & Montana	3,500	67	234,500
Anaconda	4,250	61	259,250

La France	6,200	421,600
Miscellaneous	6,200	465,000
Total	437,255	29,017,550

. The Butte Copper Exploration Co. has suspended work on the Six O'Clock group of claims on the east side of the district. Many persons bought stock under the impression that the company owned the ground and had title to the claims it has been working, but it only has a lease and option, which will expire in August. The company was capitalized for $500,000 and all the stock was issued, but it is stated now that only $150,000 was realized, although many persons who were let in "on the ground floor" paid $3 per share for the stock. There was a good shaft on the Six O'Clock when the company took over the property and it was sunk to a depth of 1,000 ft., from which point a cross-cut was driven north. A big vein was cut and some driving was done on it, but no commercial ore was found, and the treasury became exhausted. The backers of the company are some financial men of high standing, including the Leopolds of Chicago, Hayden, Stone & Co., Richardson, Hill & Co., and Paine, Webber & Co. of Boston. The directors of the company are N. Bruce McKelvie, Frank E. James, and Thomas Dee of Boston; A. E. Leopold and Warren Nichols of Chicago, and E. A. Nichols and J. E. Corrett of Butte. At one time the stock sold at $7.50 per share, but lately it has been offered at 25 cents. Some of the owners of the claims say an extension of the options is sought, but men interested in the company, residing in Butte, deny that. If the options are allowed to expire and the property reverts to the owners, the stockholders will lose all the money they invested.

The Afro-American Mining & Milling Co., composed entirely of colored men of Butte and New York, has increased its capital stock from $200,000 to $500,000 for the purpose of purchasing additional properties. The company now owns 18 claims, eight of which, comprising 100 acres, are in the Butte district. One group adjoins the Big Bonanza mine, and several claims are in the Meaderville district. Five full claims are in Madison county, upon which considerable work has been done, and a group of five claims is situated in the Willow Creek district of Lewis and Clark county. On the last a shaft is being sunk and an adit driven, the latter being in about 100 ft. on a vein from which some good assays of copper, silver, and gold have been taken.

The Boston & Montana Co. is placing in position its new hoisting-engine at the Pennsylvania mine. The engine is a direct-acting Corliss with 32 by 72 in. cylinders, and will be capable of working to a depth of 3,200 ft. Its weight is 500,000 lb., and it will lift 24,000 lb. The shaft of the Pennsylvania is between 1,700 and 1,800 ft. deep, and with the new engine this depth can be doubled. A new steel head-frame will be erected at the Pennsylvania, and new boilers, machine-drills, and compressor, are being added. It is the intention of the company to resume sinking on the shaft as soon as the new equipment is in place and carry it to a depth of 2,500 ft. without stopping. The Pennsylvania mine is yielding about 1,000 tons of ore per day, and has been doing that for years.——The new engine ordered for the Tramway mine, a duplicate of that being placed at the Pennsylvania, has been shipped from the East, but has not yet arrived in Butte. The foundation for it at the Tramway has been completed for some time and an iron building is being erected over it. The Tramway shaft has reached a depth of 1,000 feet.

The Butte Coalition Co. is now producing in excess of 1,500 tons of ore daily, and the production has reached as high as 1,650 tons per day. The average yield of the ore mined now is probably not more than 60 lb. copper per ton, as the Coalition, like all other companies in the Butte district, is holding its high-grade ore in reserve, and is sending its lowest grade to the smelter while the price of copper is high. It is the expectation of the Coalition Co. to mine about 2,000 tons per day by the first of next year.—— Fifteen Calumet men, including several officials of the Calumet & Arizona Co., have formed an exploration association for the purpose of exploiting a group of claims in Jefferson county, in a district just east of Butte. They have spent about $15,000 on the property, and will put in $30,000 more in opening the mine, which has every indication of being valuable. John L. Vivian, for a number of years superintendent of the surface work for the Tamarack Co., has resigned that position to take charge of the work in Jefferson county. The work so far consists of an adit into the side of the hill, which has disclosed a vein with some likely looking ore.

The shaft of the British-Butte Co., several miles west of Butte, has reached a depth of 200 ft. The company is mining for placer gold and is sinking to bedrock. The surface of the ground was worked for gold in the pioneer

days, but no work was ever done below a depth of 20 to 30 ft. It is surmised that bedrock will be found at between 300 and 500 ft. below the surface. Good results from tests are found in every foot of the shaft, and the company has hopes of finding rich gold deposits on bedrock. A number of London men are interested in the company, and an expert named Charles Olden has been in Butte for several weeks.

Toronto, Canada.

A Deputy Minister of Mines.—Cobalt Flotations Continue.—Shipments of Ore.—News From the Mines.—A Copper Concentrator.

A. P. Low, director of the Canadian Geological Survey, has received the appointment of Deputy Minister of Mines in connection with the organization of the new Department of Mines at Ottawa. He will continue at present his duties as Director of the Survey in addition. Dr. Eugene Haanel, now Superintendent of Mines, is appointed Director of the Mines Branch.

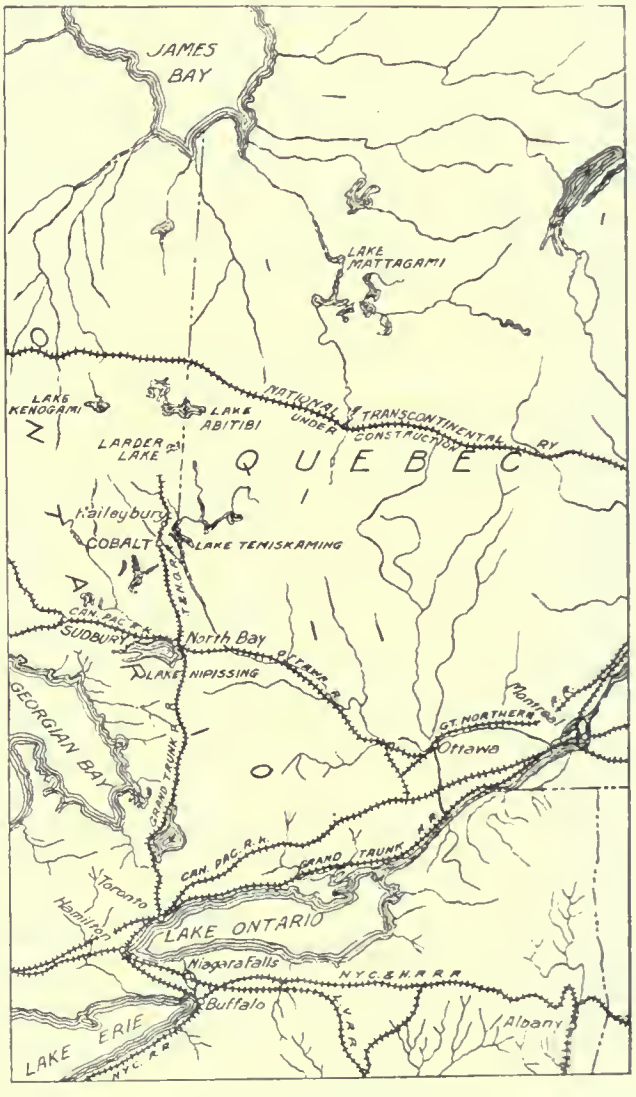
Cobalt mining stocks are much depressed, and buying by the general public has almost ceased, but there is no cessation in the incorporation of new companies, ten or a dozen of which are floated every week. Shipments of Cobalt ore, which has been light for some time, showed an increase for the week ending may 25, with a total of 435 tons, made up as follows: Nipissing, 123 tons; Trethewey, 111; Coniagas, 73; O'Brien, 63; Buffalo, 41; Townsite, 3; Cobalt Central, 20 tons. A number of the low-lying properties are idle, owing to flooding, and it will be some time before work on them can be resumed. Transportation conditions having considerably improved shipments from the chief producing mines are likely to be, large. Machinery, much of which has been for some time under order, is also coming in freely. The new vein on the Nipissing, which is considered more valuable than any yet found on the property excepting the bonanza vein No. 49, runs from 4 to 12 in. wide and has been uncovered for 200 ft. It is described as a mass of native silver from which $10,000 worth of ore has been taken in two days. One nugget, said to be 7% silver, weighs half a ton. This week the McKinley-Darragh struck this vein and is taking out enormous quantities of rich ore. The other veins of the McKinley-Darragh are also yielding well. ——It is estimated that the number of men now actually engaged in mining in the Cobalt camp is fully 3,000, and the staffs of the leading mines are beiug steadily increased.——At the La Rose work is being started at the 400-ft. level. The shaft of the O'Brien is down 300 ft. on ore of good quality. The Silver Queen has struck a 4-in. vein of high-grade ore on a cross-cut at the 75-ft. level, and has a quantity of ore ready for shipment. At the Silbert mine on Clear lake a double compartment shaft is being put in and a cross-cut made at 200 ft. A force of 16 men is working on the Big Ben property developing three veins. One shaft is down 50 feet.

The rush up the Montreal river continues and it is estimated that fully 2,000 men have gone into the district this spring. By actual count over 100 canoes per day have been seen going up the river for some days last week. Merchants at Latchford have been taxed to their utmost capacity in supplying outfits.

At the Laurentian gold mine in the Manitou Lake district, driving at the 200-ft. level shows that the zone of rich schist is increasing with depth. Thirteen tons of dynamite are in storage half a mile from Wabigoon waiting transportation to the mine as soon as navigation permits. On three properties northeast of the Laurentian, rich indications of gold have been discovered and some good specimens are shown.

The Superior Copper Co., the leading promoters of which are Frank Parry, George Kemp, and F. C. Smith, will erect a large concentrating plant on the Ontario side, just west of the plants of the Lake Superior corporation, for the treatment of copper ore. They will build a railway five miles in length from the Algoma Central to the Superior mine, on which they have already spent several hundred thousand dollars in development work, having large accumulations of ore ready for shipment. The plant will have a capacity of 400 tons per day. The Stanley Lead Co. and the Grey & Headley Zinc Co. will establish smelters at Kingston, the city having granted them free sites and exemption from taxation.

At the Laurentian gold mine, work is progressing well; the new Knowles duplex pump and boilers installed at Crystal lake, are in operation supplying water to the



The New Mining Regions of Ontario.

mine at the rate of 500 gal. per min. Chauncey Whetmore, formerly of Sonora, Cal., is now in charge of the 20-stamp mill, which is running to full capacity. The staff has been largely increased and a new scale of wages adopted. Machine runners receive $3.25 per day; helpers, $2.90; and carmen, $2.75—an advance of 25c. per day all round. Anthony Blum, the president, will revisit the mine on the opening of navigation.

A great rush of prospectors in canoes has begun up the Montreal river, notwithstanding the hardships of the route, the river being at last accounts full of floating ice. Steamers have begun to run. Numerous development parties are going up to work on claims in James and adjacent townships.——W. F. Brunne was in Toronto this week on his way to New York, after making an inspection of the Larder Lake area for the Manhattan Cobalt

Co. He states that he visited all known discoveries, and found that the extent of the gold-bearing belt was at least 10 miles. He brought samples of free gold taken at every mile of the area. On the Manhattan Cobalt properties, situated on the trail to Lemieux lake, shafts have been put down 20 and 14 ft. In the former is a quartz vein rich in free gold.——The Blue Bell Mining Co., which is shipping a stamp-mill to Larder, has engaged W. E. Hotson of New York as engineer.——On one of the claims of the Larder Central Goldfields Co. at Lemieux lake, a good calcite vein has been discovered, the ore yielding copper as well as silver and gold.——The lack of even a good wagon-road is causing much difficulty and expense in the transportation of machinery into the Larder and Lemieux Lake districts.

Johannesburg, Transvaal.

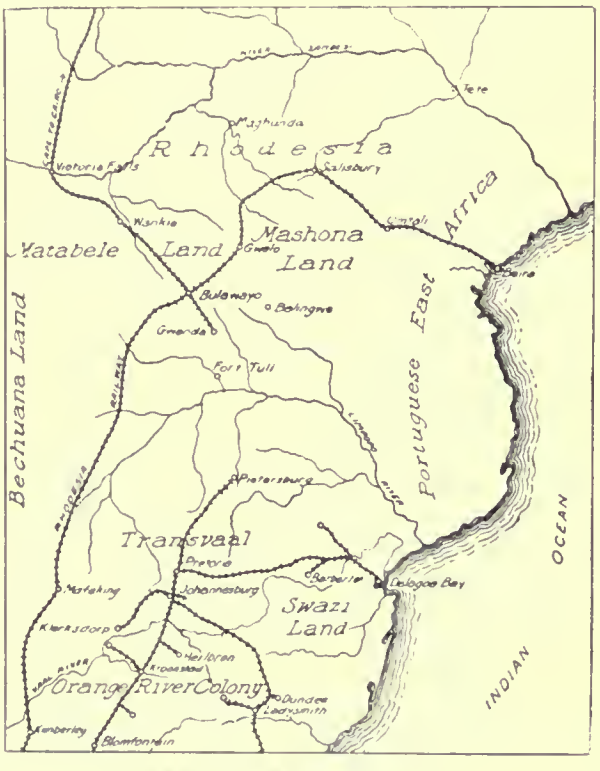
Training of Young Men.—Unhealthy Conditions Underground.—The New Metallurgy.—Unsatisfactory Results.—Another Gamble in Diamonds.

One of the problems that has engaged the minds of mine managers and others for a long time past is what to do with the thousands of youths growing up in our midst. There is an excellent institution, the Transvaal University College, where young men who are to be the assayers, surveyors, and managers of the future, can take a four years' course to learn their work, but this class is only a small proportion of the total of young men in our midst. At one time it was hoped that the expansion of other industries, such as agriculture, base metals, etc., would more than absorb the rising generation, but as there is practically no expansion going on in the country, the managers of mines have felt in duty bound to do something for the youths on the mines. On the surface, lads have been apprenticed to such trades as carpenter, blacksmith, and fitter, for some time. Many have taken advantage of this scheme, and are being trained as the skilled artisans of the future. The Mine Manager's Association has taken up the question of employing likely youths to learn underground work. The idea is to allow a young man of 18 years of age to start an apprenticeship of three years, during which time he will get experience in all branches of underground work. Only those able to pass a rigid medical test will be allowed to go in the mines. It is useless to start the weaklings in this strenuous work. The young man will start at a living wage, and every six months he will receive an increase until at the age of 21, he will be eligible for the £1 per shift.

No doubt this scheme of the mine managers is an excellent one, and many young men will take advantage of it. One deeply regrets, however, that the hygienic conditions of the mines, especially for rock-drill miners, are not much better. Competent medical men have stated that a man working continuously on rock-drills in the mines of the Rand will have an average life of seven years. A this rate a youth who puts in three years learning his trade, will only have four years in which to practice it. Of course, the underground conditions are being improved all the time and it is to be hoped that the prevention of dust and better ventilation will more than double the life of the men working underground.

Some time ago Messrs. G. A. and H. S. Denny announced, with a great flare of trumpets, the triumph of their metallurgical innovation. Several of the mines under their technical control spent thousands of pounds to install the process of circulating cyanide solutions, advocated by the Denny brothers. The following paragraph from a speech delivered at the annual meeting of the New Goch mine, by Mr. George Albu, the chairman, is rather disconcerting to the 'new metallurgy': "In addition to other drawbacks we have experienced considerable trouble with our new metallurgical plant. Whatever theoretical merits the system of circulating cyanide solutions may possess, the fact remains that the one check depended upon to ascertain the average value of the ore going into the mill, namely the screen-assay, is effectually destroyed. Our managers and technical advisers have endeavored to overcome this difficulty, but apparently without any great success, and consequently we have been frequently disappointed at the end of the month in the quantity of gold won, having been misled by the unreliable nature of the screen-assays. I do not propose to enter into technical details, but the suggestion is now under consideration to abandon the use of circulating cyanide solutions and revert to what is known as the decantation process, supplemented by the filter process."

Common caution should have prevented the introduction of the 'new metallurgy' on more than one mine, until it was proved an unqualified success. Because a



Map of the African Goldfields.

scheme works well for a few weeks it is not safe to pronounce it a success. An actual working test of a year or so is necessary when such a proposition as the new metallurgy is suggested. It is fortunate for the rest of the Rand that conservative councils prevailed, and that the mines of other groups did not take up the metallurgical schemes so persistently promulgated by the Messrs. Denny.

The Lion Hill diamond mine which had such a meteoric rise, has fallen to the earth like a stick. The stock went from £1 to nearly £20 and for awhile was the favorite horse on the racecourse, I mean the Johannesburg Stock Exchange. Today they are passed over and no doubt will pass away altogether. Another gambling bubble has burst. Great things were talked about the Barberton Copper Syndicate, and the shares were worked up to £50. Dr. Corstorphine's report throws the clear light of a trained geologist on the business, and from his report it is easy to see that the syndicate has no copper mine at all, but only a prospect of doubtful value. And yet when another such scheme comes along, people will buy the shares.

Concentrates.

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

THE percentage of gold extracted by the appliances on a dredge is uncertain; it ranges from 60 to 90%, with a leaning to the smaller proportion.

FLOURED QUICKSILVER is recovered in the barrel in which the battery residue is treated at the time of a clean-up. Some of it is arrested on the blanket-tables or in the canvas-plant.

THE Brunner-Mond and De Laval spelters are both high-grades of metal, but do not fetch quite so good a price as the Bertha and Horsehead brands of the Bertha Mineral Co. and New Jersey Zinc Co. in this country.

A 'BLOW-OUT' is a large body of quartz, irregular in shape, and without persistence in depth. It has none of the regularity of form associated with a vein, nor has it the continuity characteristic of lodes generally. Some 'blow-outs' in Nevada are of vast size and appear to be encasing shells developed upon the upper side of laccoliths.

FLUORSPAR, or fluorite, the fluoride of calcium, CaF_2, although it occurs widely associated with other minerals in veins in many geological horizons, is found in commercially important quantities in but few places within the United States, though there are reported to be other deposits which could be exploited to advantage if transportation facilities were adequate.

ASIDE from the various forms of rock gypsum, two less massive forms of the mineral are to be noted as being of commercial importance. In certain Western States and Territories, deposits of earthy gypsum, gypsum earth, or gypsite occur. These deposits contain an impure, earthy, granular form of gypsum. Deposits of gypsum sands are also found in the West, being dunes or heaps of fine grains of gypsum.

IN America, particularly in Texas, black flint pebbles occur in quantity on the banks of the Colorado river. Some pebbles are also found in Florida, California, and Kansas. In Colorado and other mountainous States there occur numerous white, light gray, or drab flints or cherts which may some day be utilized. Since the introduction of the tube-mill for fine grinding of mineral substances there has been a rapid growth in the demand for flint pebbles.

DEPOSITS of amorphous phosphate rock are known in various geological horizons from the Silurian to the Tertiary, and they are forming at the present time in many parts of the world. Important deposits have been reported from several States, but all of the domestic supply comes from Florida, South Carolina, and Tennessee. Arkansas, which was formerly a producer, but dropped out of the list in 1904, has become active again in 1906.

ROCK GYPSUM occurs in the form of beds, frequently closely associated with beds of rock salt, and almost always interstratified with thin beds of limestone and thicker beds of red shales. Such gypsum beds may vary greatly in extent, as well as in thickness. Beds now worked in different American localities, for example, vary from 6 to 60 ft. in thickness. The gypsum occurring in the beds frequently contains a considerable percentage of impurities.

THE lavish manner in which the United States has consumed the products of its forests and the rapidity with which our timber supply is melting away are wholly unappreciated by those who have never given the matter more than passing consideration. Familiar as all are with the use of wood for every purpose and in every industry, it is only when the various items are added that there begins to come a realization of the indispensable place the forests fill in the national economy.

A CORRESPONDENT asks the following question:

Suppose the hammer in an air-hammer rock-drill weighs 3 lb., the diameter is 2 in. and the stroke 3 in. Neglecting all frictional resistances, loss of air, etc., under a pressure of 100 lb. on the hammer, what would be the weight of the blow struck by the hammer?

Initial pressure of air = 100 lb. per sq. in. Not knowing the pressure effective in the cylinder nor the size of aperture, we shall have to assume wire-drawing losses and take the mean effective pressure at 65 lb. per square inch.

Diam. piston = 2 in., area = 3.1416 square inches.

Mean effective force on piston = $65 \times 3.1416 = 204.2$ lb.

Work done = force × distance.

$= 204.2 \times 3/12$ (3-in. stroke).

$= 51.05$ foot-pounds.

As the work is all done on the hammer, and the friction is neglected, the work can be measured by the change in kinetic energy of the hammer.

Change in kinetic energy $= \frac{w}{2g}(v_1^2 - v_0^2) = 51.05$ ft. lb.

Since the hammer starts from rest, in this case $v_0 = 0$ and

$$v_1^2 = \frac{51.05 \times 2 \times 32\,2}{3} = 1{,}095.7$$

$v_1 = 33.1$ ft. per sec.

The blow would be about equivalent to dropping a hammer of this weight freely for 16 feet.

A MINING CLAIM was located in 1904 by *A*. The annual labor for 1905 was properly performed. At the end of December, 1905, or on January 1, 1906, one day's work was done. Nothing more was attempted during 1906. In February, 1907, *A*, being a non-resident of the State, causes the claim to be re-located for himself through an agent. Thereafter *B* re-located it. Which has the right of possession?

The claim was subject to re-location in January, 1906, and at any time thereafter, and prior to February, 1907. The one day's work was not a sufficient resumption to prevent re-location. The question stated in the inquiry is to be solved by determining the legal value of a re-location made by *A*, through his agent in February, 1907, such re-location being based upon *A*'s own neglect to do the assessment work for the year 1906. So far as the State Courts have dealt with this question, they support the right of the original locator to re-locate his claim under the circumstances stated. If this rule be sound, *A*'s title under his re-location would take precedence over *B*'s. None of the Federal Appellate Courts have had occasion to pass upon the question. It was before the Supreme Court of the United States at one time, but the appeal was dismissed without decision on the merits. The text-book writers concur in the view that a delinquent locator cannot take advantage of his own delinquency to create a new estate in himself by re-locating. If their views be adopted, *A*'s re-location is invalid, and *B* will hold the ground. Notwithstanding the decisions of the State Courts above referred to, the question is considered to be an open one. It will require a ruling from the Supreme Court of the United States to settle it definitely.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy.

Assay of Cyanide Solutions.

The Editor:

Sir—Having noticed the schemes for the 'Assay of Cyanide Solutions' in the PRESS of March 5, by Mr. Gendar, and of May 4, by Mr. Muir, I wish to call attention to the following well-known method, which I have found quick and accurate.

To a convenient quantity of KCN (working solution) add an excess of weak copper sulphate solution. Acidify with dilute sulphuric acid. Filter the precipitate, which is white (or light-bluish green) and flocculent, and which contains all the gold and silver. Wash the precipitate twice with hot water; dry filter-paper and contents by placing them in a crucible and heating in a muffle; flux filter-paper and precipitate, fuse, cupel, part, and weigh.

To solutions weak in KCN add a small piece of KCN salt, in order to give a good precipitate of copper cyanide.

AUGUSTUS MACDONALD.

Zacatecas, Mexico, May 17.

Cyanide Practice at Copala.

The Editor:

Sir—In regard to saving cyanide in the treatment of gold and silver ores, we have been enabled by a simple method to reduce our cyanide consumption from 4.5 to 1.5 lb. per ton of ore treated, and the results are so interesting that I herewith tender them for publication.

When we first commenced treatment in October 1905 our protective alkalinity in the working solutions was carried at 0.04% (in terms of caustic soda), and the cyanide consumption varied from 4.3 to 4.5 lb. per ton of ore.

The ore is valuable for its silver, which occurs as a sulphide, and carries from 12 to 20 oz. of this metal per ton, together with a small quantity of gold. We find that 5.2 lb. of lime per ton is sufficient to keep the alkalinity at 0.04%. Our extraction has been good, averaging 93% of both gold and silver, and, accepting the fact that a certain amount of cyanide will of necessity be constantly tied up as a double cyanide of zinc and sodium (using sodium cyanide), we have not considered the amount abnormal, though the advisability had been discussed of installing electrolytic precipitation to obviate this loss of potential free cyanide. However, in reading over 'The Cyaniding of Gold and Silver Ores,' by Julian and Smart, I noted what was said (page 99) in regard to the decomposition of the double cyanide (Na_2ZnCy_4) by an increase in the free alkali. W. R. Feldtman is there quoted as saying: "The addition of alkali to working cyanide solutions which have become somewhat weak in alkali, brings up the strength by regenerating, i. e. decomposing, the zinc cyanide, so that as a matter of fact, when the solutions are pretty strongly alkaline they contain no zinc as cyanide, but only the hydrate dissolved in alkali."

With the object of ascertaining what results could be obtained by increasing the alkalinity, I commenced adding lime, and kept gradually increasing the same until the solutions tested 0.2% alkalinity. Our working solution for slime, which we carry at 0.125% KCy, at once began to gain in strength, and kept growing gradually stronger until it showed 0.3% KCy; the alkalinity was then allowed to fall to 0.09%, when cyanide strength also fell. After many experiments with various strengths, I found 0.135% to be the least alkalinity with which I could regenerate, and consequently I have kept the alkali at that strength ever since.

As a result of this regeneration, our cyanide consumption has not exceeded 1.5 lb. per ton treated for more than five months; as a matter of fact, no cyanide was added to the slime-treatment solutions for nearly 13 weeks, and the amount used to bring the leaching-plant solutions up to strength was small; this of course was due to the large excess of zinc cyanide then existing in the system.

In regard to the testing for alkali, we first determine the free cyanide by titrating with standard silver nitrate solution to the first faint opalescence, without the use of the potassium iodide indicator; we then add a few drops more of the silver nitrate to make the opalescence well defined, and titrate with N/5 oxalic acid solution using phenolphthalein as indicator. This is the method recommended by J. E. Clennell, and as it has been found to check very closely with L. M. Green's ferrocyanide method, and also with that of Gerard Williams published in the *Journal* of The Chemical Metallurgical & Mining Society of South Africa, it has been adopted by preference on account of its simplicity.

Finally, I would say that up to date there is no indication of increase in our cyanide consumption, and as this work has been going on for the past five months I have come to the conclusion that the regeneration has assumed constant proportion.

L. McN. B. BULLOCK.

Copala, Sinaloa, Mexico, May 4.

Copper in Serpentine.

The Editor:

Sir—In the issue of February 23, Mr. C. Y. Knight notes an occurrence of bornite flakes in serpentine on a claim at Shingle Springs, El Dorado county, California. Although I have not seen the serpentine occurrence referred to, I have examined in considerable detail the portions of the northern extension of the serpentine belt in Siskiyou county, California, and Josephine county, Oregon. Presumably the serpentine of the north is similar in composition and origin to that of El Dorado county.

Contrary to the suggestion of Mr. Knight, I am of the opinion that the serpentine is an alteration from an original basic igneous rock, a peridotite or olivene diabase. In the northern counties the belt is very extensive and characterized by the occurrence of peculiar and interesting mineral associations. Copper in the form of chalcopyrite occurs in lenses at various points, without quartz or other gangue association, as far as I have observed. That the original basic rocks from which the serpentine is derived contained indigenous metals is highly probable. The alluvial gold deposits of this region contain a small amount of platinum. The fact that this platinum was an original constituent of the peridotite is fairly well established. An association of nickel and copper with platinum as original constituents of basic rocks is not infrequent, although the form in which these metals may occur in the rock matrix is uncertain. Even the chalcopyrite lenses in the serpentine of Josephine county are probably due to secondary segregation. In any case the bornite flakes noted by Mr. Knight would be the result of a change—perhaps more than one—from the original copper occurrence. For this much is generally believed; that bornite is secondary, frequently after chalcopyrite.

If it be allowed that the original country rock was a peridotite, diabase, or gabbro, now changed to serpentine, it would be strange if changes in the form of metallic minerals did not accompany this rock metamorphism. The original mineral with copper content may have been

iron pyrite. It may have been pyrrhotite or chalcopyrite. In the course of examination of a large copper deposit I once had delicate assays made of specimens of fresh olivene-diabase remote from any mineralization. Traces of copper were found in every case. Thin sections of the same rock showed the presence of a small amount of iron pyrite and no other metallic sulphide. In Silver Bow Basin, Alaska, I have seen indigenous pyrrhotite heavily impregnating a basic gabbro.

The relation of copper and copper ore to basic rocks is one of fascinating interest, and it seems to me that the researches so far pursued have been less satisfactory in results than many other branches of inquiry into the character of ore deposits. Mr. Knight raises a timely question, and I beg leave to submit the above remarks in the way of calling attention to the importance of the query, rather than as an explanation.

C. W. PURINGTON.

Munich, April 15.

Assay of Cyanide Solution.

The Editor:

Sir—Mr. Gendar's modification of the Crosse method given in your issue of March 30 is quick and accurate, but while doing away with tedious evaporation and chance of loss in the furnace, it is open to the objection that it cannot be used for the estimation of the silver. Seeing that the cyanide process is becoming widely employed on silver ores, this is a great objection. In the majority of cases some modification of either the Argall or the Chiddey method will fit in nicely with solutions carrying gold or silver or both; but the Argall method, necessitating either scorification or pot-fusion, gives the preference to the Chiddey method. At the Queen Esther mill at Mojave, California, and the Tombstone Consolidated Mill at Tombstone, Arizona, I have found the Chiddey method to meet all requirements on solutions running from traces up to 7 oz. Ag and 0.25 oz. Au.

The following is the Chiddey method now used here: Take 292 c.c. (10 A. T.) solution in a large beaker; add 5 gm. zinc shaving and 40 c.c. of a 20% solution of commercial lead acetate. Bring to a boil and place in a fume closet or an open window, and add 40 c.c. commercial HCl. When action nearly ceases, boil again. Pour off the waste solution and squeeze the wad of spongy lead into a cube, place it between filter-paper and squeeze it dry by standing on it. By folding the cubes of lead in pieces of leadfoil the weight can be increased to about 10 gm. each, giving a better cupellation and preventing any particles of lead from being detached from the main bulk, if any moisture happens to be left in the cubes. I have found that solutions obtained in treating pan-amalgamation tailing containing mercury sometimes cause the lead to be too brittle to wad together nicely in a cube, and I have overcome this somewhat by taking more lead acetate and less of the solution.

The average of 28 determinations on Queen Esther solutions by the Argall method was Au 0.0183 oz., Ag 1.416 oz.; by the Chiddey method Au 0.0181 oz., Ag 1.438, the Argall being + 0.0002 oz. on the gold and the Chiddey + 0.022 oz. on the silver.

A curious thing about these cubes of spongy lead is that when squeezed free from the waste solution, but yet moist, they will become heated so quickly that you can detect it with your hand. This, I presume, is due to the rapid oxidation. I have not found any advantage in filling the muffle with wood-smoke as suggested by Chiddey, and I cupel these cubes just like ordinary assay-buttons.

The Electric-Air Drill.

The Editor:

Sir—In the interesting page of 'Concentrates' in your issue of May 11, there is a paragraph which will be understood as referring to the electric-air drill and which conveys a distinctly erroneous impression. As a description of this drill has appeared in your columns, those who read that article with any care will not be misled; others may be, to their loss. The paragraph referred to says: "One of the later and interesting developments of compressed-air drills has been the addition of a small electric motor driving a little local compressor for supplying the operating power to the drill." This of course carries the impression that the drill is essentially the familiar air-driven drill with the compressor placed near the drill instead of in the power-house. The drill, in fact, is neither an electric drill nor an air-drill, as these have been known, and the so-called compressor is as much an expander as a compressor of air, and should rather be called a pulsator.

The same air is used over and over again, and not only its full pressure when compressed but all of its pressure during the act of compression is utilized. The air-cushioning of the piston on the back stroke also is made to increase the force of the blow, this air-cushioning being in fact a carrying over of power from the previous stroke. From being, what the standard air-drill is, a most extravagant and wasteful user of power transmitted by a column of air, the electric-air drill is the most economical of power of any of the electric, electro-pneumatic, or pneumatic tools, and at the same time it is more efficient than the drills it takes the place of. It is unfortunate in that its principle of action is so novel that it is difficult to speak of it briefly and yet give a completely correct representation of its economy and efficiency. As it gets to be better known it will also be more correctly understood and more fully appreciated.

FRANK RICHARDS.

New York, May 20.

RAILWAY CONSTRUCTION IN COLOMBIA.—The Girardot railway has 80 miles under operation and 205 miles contemplated or under construction. The road runs from Girardot on the Magdalena river through Hospicio, and is to connect with the Sabana railway at Facatativa, a distance of 80 miles, and is to be completed January 1, 1908. The Antioquia railway when finished will consist of the extension of the road from Puerto Berrío to Medellín, 78 miles. The construction of a line is contemplated to join the Dorada railway with the Puerto Berrío and Medellín railway at Providencia, 75 miles and the extension of the line from Puerto Berrío to Barranca Bermeja, 50 miles. Other engineering works contemplated or in course of construction in Colombia are: The extension of the Dorado railway from Honda to Ambalema, 66 miles; the Buenaventura railway, to Buga, and the Cambao wagon road, from Facatativa to Cambao, on the upper Magdalena river, 75 miles. Some material is on the ground for the construction of the railway from the Ciudad Reyes, on the Gulf of Darien, to Medellín. A concession has also been granted for the extension of the Northern railway, from Bogotá-Zipaquirá to Chiquinquira, 40 miles.

THE exports of tin from Bolivia increased from 3,794,494 lb. in 1897 to 27,234,944 lb. in 1905. The world's production and consumption of tin in 1905 was 93,376 tons and 94,755 tons, respectively. The United States in 1905 consumed 38,470 tons, or 40.6% of the world's production.

Goldfield, Nevada.

Written for the MINING AND SCIENTIFIC PRESS
By a Special Contributor.

It was late in 1902 that the Sandstorm claim was located on Columbia Mtn. and a number of prospectors came south from Tonopah. No important discoveries were made and interest dwindled during the spring, until the Combination vein was discovered in the summer of 1903. After this discovery, the camp grew slowly to a population of 6,000 in the autumn of 1904. At this time the Jumbo, the most important mine, was being operated by a number of lessees. On the Davis and Loftus lease on the Sandstorm good ore was being shipped by shoveling the dirt and float on the hillside. So rich was the surface ore that it was found necessary to cover the rock with bull hides to prevent loss in blasting. The next important find was made on the Quartzite mine near Diamondfield, where ore to the value of $40,000 was taken out at a small depth, but both these properties have proved to be 'bunchy' in character.

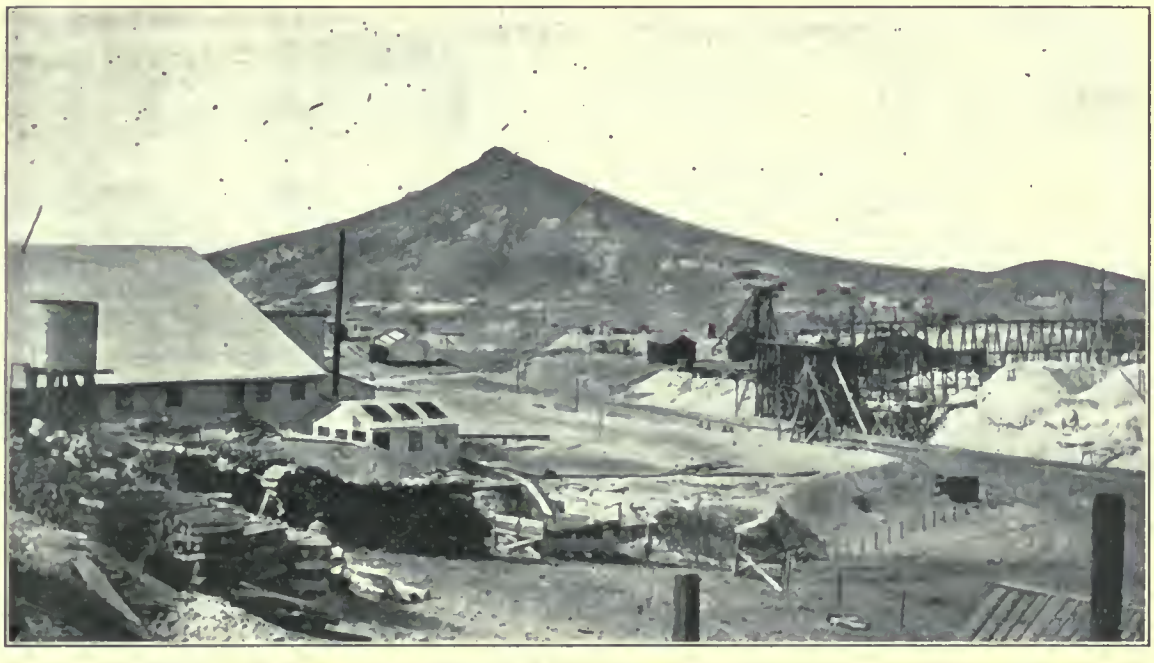
Early in the summer of 1905 the Reilly lease struck rich ore on the Florence. This was soon followed by the discovery on the Sheets-Ish lease, on the heels of which followed the opening of the great bonanza on the Mohawk, after a year's work without any results. With this discovery the demand for stock in leasing companies increased and they soon reached a greater popularity than that of the parent companies.

The discovery in the Mohawk was not without romance. At first work proceeded steadily and a shaft was sunk to 210 ft., then cross-cuts were driven at 80 ft.

Mohawk. Combination. Lava flow on top of mesa.

General View of Goldfield.

and at 210 ft., at a cost of about $15,000, but without result. The lessees were about to give up and sold a large interest for a small consideration. With this a cross-cut was driven 30 ft. on the 150-ft. level and the bonanza was found. The lode or band of mineralization had been intersected at an unproductive point. The 80-ft. level was above the ore-shoot and the 210 level was not quite long enough to reach it.



Combination mill. Columbia Mtn. Mohawk mine.

Goldfield, Nevada.

The Mohawk became the scene of intense activity. The lessees sublet the greater portion of their ground, and the Hayes-Monette, which produced more than $1,500,000, was reduced to an area of 370 by 150 ft. At one time 19 head-frames were crowded on this claim, and it had the appearance of an oilfield. So feverish was the anxiety of the lessees to make the best of their time, that surveyors could not interrupt hoisting to plumb their shafts and work was continued through Christmas day, the men being given an extra $5. High-graders, that

is, ore-thieves, made enormous hauls, and there is no doubt that over $100,000 was lost this way. It was common for the men to wear a light harness between two shirts to carry pouches full of high-grade ore, while their boots and trousers were often filled with fine stuff assaying dollars per pound. In this way a man could carry away 30 to 50 lb. each day, and this ore sometimes had a value of $5 per pound. On the expiration of many leases in December, the stealing was checked by making the men change their outer clothes in the wash-room. A general exodus of assayers occurred at the same period.

At the present time the development on the Oddie lease on the Combination Fraction is especially interesting. A shaft is being sunk to cut the Mohawk ore-shoot at about 600 ft. and this will give valuable evidence as to the character of the orebodies in depth. This lease is excellently equipped, having a two-stage compressor and hoist, each driven by a 75-h.p. motor. At Goldfield, electric power is obtained from Bishop, California,

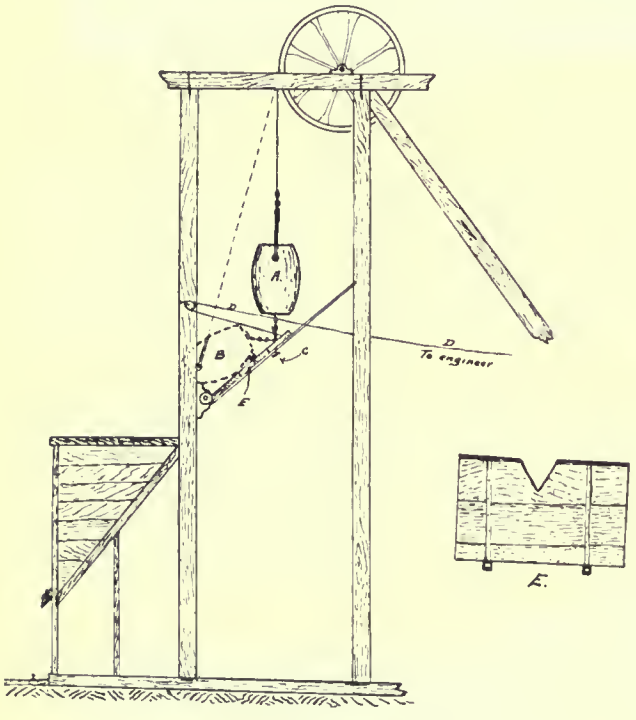


Fig. 1. Dumping Device.

whence it is transmitted at 6,600 volts and transformed to 440 volts. Electric hoists are replacing gasoline engines, the former being more reliable. The price of gasoline varies from $2.50 to $5.50 per case, while wood costs $35 per cord. A 25-h.p. gasoline hoist uses about 15 gal. per 24 hours, while electric power is about $12 per h.p. per month.

The cost of sinking at Goldfield varies from $20 to $30 per foot. Lumber at $55 is a serious item. The accompanying diagram shows a shaft sunk on the Combination mine. The shaft is 5 by 9 ft.; it cost $22 per foot, the timber alone costing $9.50 per foot. The cost of driving in country rock (a soft dacite) is only $4 to $5, and a man working alone by hand has driven 70 ft. in a month, most of the ground breaking without blasting. In the silicified zones in which the orebodies occur, the rock is hard, but the cost of driving and track-laying was not more than $5 to $7 per foot. The cost of stoping by hand is 90c. per ton.

A simple automatic dumping device is shown in the accompanying sketch, (Fig. 1). To the bottom of the bucket is attached a piece of chain or rope with a block at the end (*C*). The bucket *A* is raised to the point shown in diagram and an apron *E* is then lowered by the engineer by a string *D*. This apron is hinged and remains in a vertical position while the bucket is being hoisted, but, on being lowered by the engineer, it falls to a slope of 45°. In this apron is a V-shaped notch shown in detail sketch. This engages the block *C* when the bucket is again lowered and the bucket dumps into a car or bunker in the position *B*, a small block on the apron being used with the Cornish type of bucket.

Goldfield has the erratic topography of a recent volcanic district modified slightly by erosion. To the north is Columbia mountain, a rhyolitic peak with a mass of alaskite at its south end. Vindicator mountain has a similar origin. Myer's mountain, immediately south of the Florence mine, is a neck from which a series of

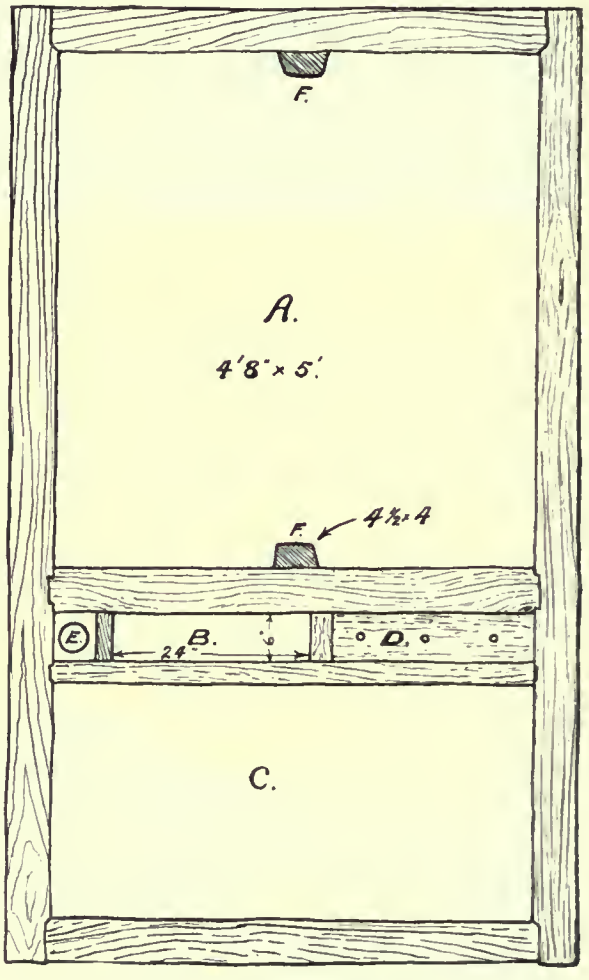

Fig. 2. Combination Shaft.

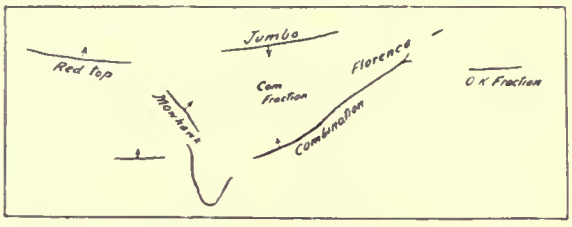
A—Hoisting compartment.
B—Compartment for balance.
C—Manway.
D—Electric cables.
E—Pump column.
F—Guides.

volcanic flows have emanated. Rhyolite flows were followed by andesites and the basalts that now crown its summit. One of the salient points in the landscape is the *mal pais* (bad land) mesa to the southwest, where sheets of lava have protected the tuffs and lake-beds from erosion.

This volcanic complex is of Tertiary age. The extent of the productive area is not yet determined. Great stress has been laid on the richness of the dacite in which the best known mines occur. But the geological evidence does not warrant this. The deposition of the valuable minerals is intimately associated with the silicification of certain bands of shattered volcanics. These are not confined to the so-called productive dacite; there seems little reason to suppose that the rich ore will be strictly confined to this narrow belt. The irregularity of the lodes is only surpassed by the irregularity of the pay-shoots. (See diagrams *A* and *B*.) The bonanzas

occur in belts of silicified volcanic rocks where other fissures seem to dip into them and enrich them. Rusty outcrops of these silicified bands break the monotony of the low hills and have naturally attracted the attention of prospectors. Of the vein system and the distribution of ore-shoots, little is known. The Combination lode, the most persistent in the district, changes in dip and strike, and developments give little information as to

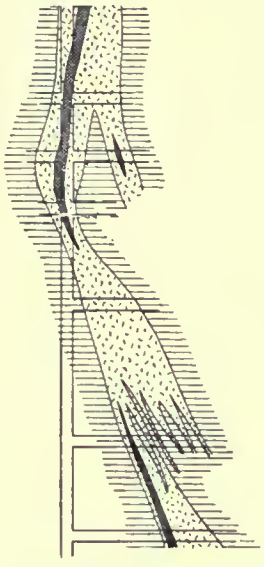


A. Plan of Vein Fractures.

any systematic distribution of ore. The rich ore occurs in irregular deposits varying from small bunches or pockets to large shoots of unknown depth. These are not always enclosed in the silicified material, but occur sometimes between it and the soft country rock. The ore is a breccia cemented by silica. The fragments themselves sometimes contain veinlets of quartz, but it is the later cementing material that has been deposited with the gold.

Silicification has taken place at several periods. After the first deposition, earth-movements have shattered the silicified material owing to its brittle character as compared with the soft rocks surrounding it. This broken and crushed stuff has been cemented by quartz with gold, pyrite, gray copper, and bismuthinite, in notable quantities. The usual gangue minerals are conspicuous by their absence. Galena, blende, and tellurides are rarely found. Of many specimens of supposed tellurides, the greater number were incrustations of gray copper (fahlerz) and some were bismuthinite. The latter occurs in fine needles and is usually associated with gold.

The extreme richness of these deposits has attracted capital and created a town out of all proportion to the basic industry of Goldfield. It has been a great distributing centre, but, with the completion of the railroad to Bullfrog, it will lose some of its importance. With the abnormal amount of development now in active progress, the immediate district will soon be fairly prospected and the character of the ore in depth will be determined. The consolidation of the principal mines has done much to remove the danger of litigation, which was threatening the camp. The attempt to define the



B. Diagram Showing Irregular Distribution of Orebodies.
After F. L. Ransome.

apex of a complex series of intersecting shear-zones of different ages, directions, and magnitudes may well become a blessing to the mining lawyers and a curse to the mining community.

Montana-Tonopah Mill in Course of Construction.

In many of the mines and leases work has been carried on without method and as a result not much systematic development has been accomplished and but little is known concerning the relationship of the different orebodies. Goldfield is in the transition stage between a young and most promising desert camp—with its usual mixture of tents and shacks, poor accommodation, and bad transportation—and a permanent mining town with hotels, theatres, and other luxuries that indicate stability. There is nothing to attract people except the mines and the business dependent on them. It would be difficult to name another camp in which such a mob can be found. Nondescript promoters, irresponsible mining engineers, 'high-graders,' and agitators, rubbing shoulders with brokers from New York and Berlin, prospectors and engineers with their burros and automobiles, all playing their game in the great casino of Nevada.

A Review of the Chemistry of Portland Cement.

Written for the MINING AND SCIENTIFIC PRESS
By F. H. MASON.

It has often been said that the prosperity of a nation may be gauged by its consumption of iron and sulphuric acid. To the consumption of these two staple articles as a barometer of national prosperity may well be added that of portland cement. Incidentally, it may be added that in each case, while the final result is more or less certain, the reactions leading up to the result are but imperfectly understood. It is a matter of fact that the leading authorities upon these subjects do not agree as to the reactions taking place in the various parts of the blast-furnace and in the lead chamber, but upon this it is not proposed to dwell. When we come to consider portland cement, we find a much greater diversity of opinion, not only in the reactions that take place during its manufacture, but also in those that bring about its setting and hardening, when the manufactured article is being put to industrial use.

The ingredients necessary to form a hydraulic cement are lime, silica, and alumina; oxide of iron may, to a certain extent, replace alumina, and, it is claimed by many, to the improvement of the cement; while it is not certain that magnesia and manganese oxide may not replace some of the alumina without detrimental results. Many natural cements are composed almost entirely of lime, silica, and magnesia, with only small quantities of alumina.

That the lime need not necessarily be in chemical combination with the other ingredients to form a hydraulic cement is evident from the fact that the ancient Roman cements—the durability and hardness of which are historic—were made by mixing fat lime with finely ground volcanic scoria, the latter being composed principally of silicates of iron oxide and alumina. It is, however, essential that the various ingredients shall be in the finest state of division in order that chemical interchange may take place.

In the manufacture of portland cement local conditions must necessarily rule the form in which the essential ingredients are assembled at the works. Thus in England we generally find chalk supplying the lime, while the other ingredients are found in river mud or clay, while in America the lime is generally provided in the form of marl or limestone, while clay or shale supply the silica and alumina. In whatever forms the necessary ingredients are assembled, it is imperative that they should be reduced to the finest state of division and thoroughly intermixed. This is generally accomplished by grinding the materials together in water; the product is allowed to settle, the water drawn off, and the residue, known as 'slurry,' dried, and burned in kilns. The clinker produced from the burning is ground, and after being allowed to season, by exposure to the air in thin layers on the floor of warehouses, it is placed in bags or barrels ready for the market.

The foregoing is, of course, simply a bare outline of the method of manufacture. It is not proposed in this article to enter into details of plant, which must of necessity vary with the different kinds of material used and with varying ideas of the designers of the factories.

Whatever the method of manufacture or of the materials employed, the lime and silica contents of all good portland cements show only slight variations. The lime generally ranges from 61 to 63%, and the silica from 18.5 to 22%. The alumina and oxide of iron are proportionately subject to a greater variation, these two substances together ranging from 12 to 16%; in European cements there is generally about twice as much alumina as iron oxide; in many American cements the alumina contents are considerably greater. The following may be considered a typical analysis of an English cement:

Insoluble matter	2.56	Lime	62.47
Silica	18.92	Magnesia	0.81
Alumina	8.76	Sulphuric oxide	0.93
Ferric oxide	4.40	Soda and potash	1.10

The insoluble matter is usually composed principally of silica, which has passed the screens in too large a form to enter into chemical combination with the other ingredients. The sulphuric oxide, magnesia, and alkalies are generally considered as impurities. Whether they will always be looked upon as such is an open question; taking into consideration the marked influence of traces of one substance upon masses of another in other industrial materials, I am disposed to think that these so-called impurities may play a far more important part than that with which they are today credited.

The sulphuric anhydride in all probability exists in the form of sulphate of lime and it is known that users of cement will often add small quantities of this substance to cement when it is desired to retard the setting.

It has been found that a cement high in lime and low in silica when properly burned will produce a material that will attain greater tensile strength than one low in lime and high in silica; it requires, however, more fuel and greater care in the burning. It is easily possible on the other hand to get too basic a cement, which will develop cracks on hardening, so as to decrease its tensile strength. Between 63 and 64% appears to be about the maximum limit of the lime contents. A cement high in alumina and properly proportioned as regards lime and silica, sets quickly and develops great tensile strength rapidly; in cases, however, where the alumina is too high, the cement will develop great tensile strength, but after a few weeks, this materially decreases—one of the worst possible features in a cement. The properties given to a cement by ferric oxide do not appear to be understood; several authorities look upon it purely as a dilutent, necessary only because of the difficulty of obtaining the other ingredients without it, owing to the wide diffusion of iron in nature. My own experience is not in accord with this. I have found that a cement in which the ferric oxide constitutes from a quarter to a third of the combined ferric oxide and aluminum contents, will generally give a greater tensile strength after three months from its setting, than one in which the ferric oxide occurs in less proportion, other things, of course, being equal. This conclusion was reached when making experimental lots of cement from varying ingredients.

There is one other common ingredient of cement that rarely appears in published analyses, namely, titanium oxide; it seldom occurs in quantities of more than one per cent, and presumably gets overlooked in the analyses, being determined either with the silica, or the alumina, or both; its source is easily accounted for, as it is a common constituent of clay. It is found in both good and bad cements, and as far as I have been able to discover, does not appear to play any part in the behavior of the material.

With regard to the setting and hardening of cement: The whole thing is imperfectly understood, and it is a most difficult problem for research. The two words, 'setting' and 'hardening,' are almost universally used; the former process in many cements is comparatively sharp; the latter is purely a gradual merging from the former state. Analyses of the cement during the stages of hardening convey comparatively little information; from it we can only learn the elementary constituents, and not the compounds into which they have resolved themselves, which is more particularly the information

desired. Some other method of investigation is therefore necessary.

The researches of M. Le Chatelier, published in the *Annales des Mines*, February, 1888, are unique, and while they will be familiar to many readers of this paper, they are so interesting and the method of investigation is so original, that a brief review of them will be pardonable. The sections of the original clinker and of the cement during the stages of hardening were cut and examined under the microscope by the aid of polarized light; various crystalline, non-crystalline, and amorphous bodies were observed. As these bodies could not possibly be separated and subjected to analysis, Le Chatelier hit upon the happy idea of synthetically building up similar crystals and comparing their optical properties with those found in the cement. At the first blush this might appear an endless task, but, while the research was a lengthy one, Le Chatelier was able to confine himself to a comparatively small field. He knew the analysis of the cement, and by neglecting traces (this in a broad sense), he could limit himself to the various chemical combinations existing between lime, silica, alumina, and ferric oxide.

The salient features of this research were the discovery in cement of:

1. A substance having no action on polarized light, crystallizing in the cubic system; similar crystals were made consisting of tricalcium aluminate $3CaO,Al_2O_3$.

2. A substance acting feebly on polarized light. Supposed to be calcium silicate $3CaO,SiO_2$.

3. A strongly brown colored substance, acting on polarized light, and swelling when moistened; a similar substance was made consisting of calcium alumino-ferrite, $3CaO(AlFe)_2O_3$.

4. Small crystals having strong polarizing action on light, not abundant, supposed to be a compound of magnesia.

During the hardening, hexagonal plates similar to calcium hydrate were always present.

In highly aluminous cements long needles of considerable dimensions, interlacing, were found; these were supposed to be due to the action of water on $3CaO,Al_2O_3$; and to be the cause of the initial setting of cement.

Other substances were found, the composition of which was not satisfactorily determined; Le Chatelier concludes that:

1. The calcium compounds of cement when tempered with water, are first decomposed, yielding calcium hydrate.

2. When tricalcium compounds are decomposed by water they form hydrated ortho-calcium silicate, and hydrated calcium aluminate. The calcium alumino-ferrite swells and appears to slake like quicklime; of no importance.

3. That the setting is caused by the hydration of tricalcium aluminate, while the hardening is caused by the hydration of the tricalcium silicate.

While I would not detract one iota from the praise due for this excellent, lengthy, and painstaking research, which will couple Le Chatelier's name with the cement industry for all time, it is fair to point out that the results cannot be accepted with the same finality that analyses of the substances found under the microscope would have, had it been possible to have separated them mechanically. Le Chatelier's researches have in many respects been borne out in practice.

As has already been stated, highly aluminous cements quickly attain great tensile strength, but they do not retain that strength. If, as Le Chatelier suggests, the setting is due to the interlacing of the long crystals of calcium aluminate $4CaO,Al_2O_3,12H_2O$, the subsequent weakening of the cement is explained, when it is shown that the calcium aluminate loses water in dry air.

It is well known that a straight silica cement — that is a cement composed almost entirely of lime and silica — will, if given time, set and ultimately attain great strength, but owing to the fact that it often requires months to set thoroughly, for most purposes it is of little industrial value. This again would appear to bear out Le Chatelier when he claims that the ultimate hardening is due to the hydration of the tricalcium silicate.

Slag cements made by granulating, drying, and finely pulverizing blast-furnace slag and intimately mixing it with slaked lime, when properly proportioned and thoroughly mixed, are excellent. The slag supplies the silica, alumina, and part of the lime, while the calcium hydrate is necessary, not only to provide the deficiency in lime, but also to bring about the necessary chemical reactions; once again bearing out Le Chatelier when he shows the invariable presence of calcium hydrate during the setting process.

With regard to the calcium alumino-ferrite; surely a substance that "appears to slake and swell like quicklime" requires something more than passing notice; for, if the swelling should take place after the hydration of the calcium aluminate, it would disintegrate the crystals and weaken the material. Every cement-maker knows and, as a matter of fact, Le Chatelier himself points out, that a good cement must not contain free lime, for this very reason. If, on the other hand, the calcium alumino-ferrite slakes immediately it is tempered with water, may it not be the means of supplying calcium hydrate and provide the lime necessary for the conversion of $3CaO,Al_2O_3$ into $4CaO,Al_2O_3,12H_2O$, and if so, may not the alumina and ferric oxide thus set free seek association with some of the silica to form stable double silicates, thus contributing to the hardness of the material? The whole subject is full of interest, and I know of no more open field for profitable research to those who have the opportunity of following it.

MINING IN ALGERIA.—A remarkable development is going on in mining in Algeria. Some of the zinc and lead mines opened last year have been successful, and the shares have doubled and in some instances more than quadrupled in value. Mines of mercury have been opened this year and are said to promise well. A feature in this department is the resumption of shipments of iron ore to the United States. About 15,000 tons have been shipped from Beni-Saf, and large shipments are announced for the present year. A concession has been given for a sulphur mine near Guelma, and work has just begun. The extraction of phosphate rock in Algeria has exceeded that of 1905, but in Tunis the output has been very much more important.

ADVICES FROM SCOTLAND indicate that negotiations are now in progress for a huge coal amalgamation in the Lothians, in which quite a large number of the principal collieries in East Lothian and Midlothian, which is a leading centre of the mining industry in Scotland, will be embraced. The capital of the combine, it is believed, will amount to about $6,125,000. The collieries will employ about 7,000 men, and it is expected that the proposed arrangement will lead to a much greater development of mining throughout the east of Scotland. The output in East Lothian has been more than trebled in the last three years. Submarine seams are now being worked under the Firth of Forth, where it is estimated that there is a coal area sufficient to give an annual output of 35,000,000 tons of coal for the next 160 years.

The Ancient River Channels of California.

Written for the MINING AND SCIENTIFIC PRESS
By GEORGE W. KIMBLE.

These channels have furnished not only a large portion of the gold produced in California, but they have afforded a most interesting subject of study ever since their discovery in the early days. They have received the attention of many geologists, mining engineers, and miners.

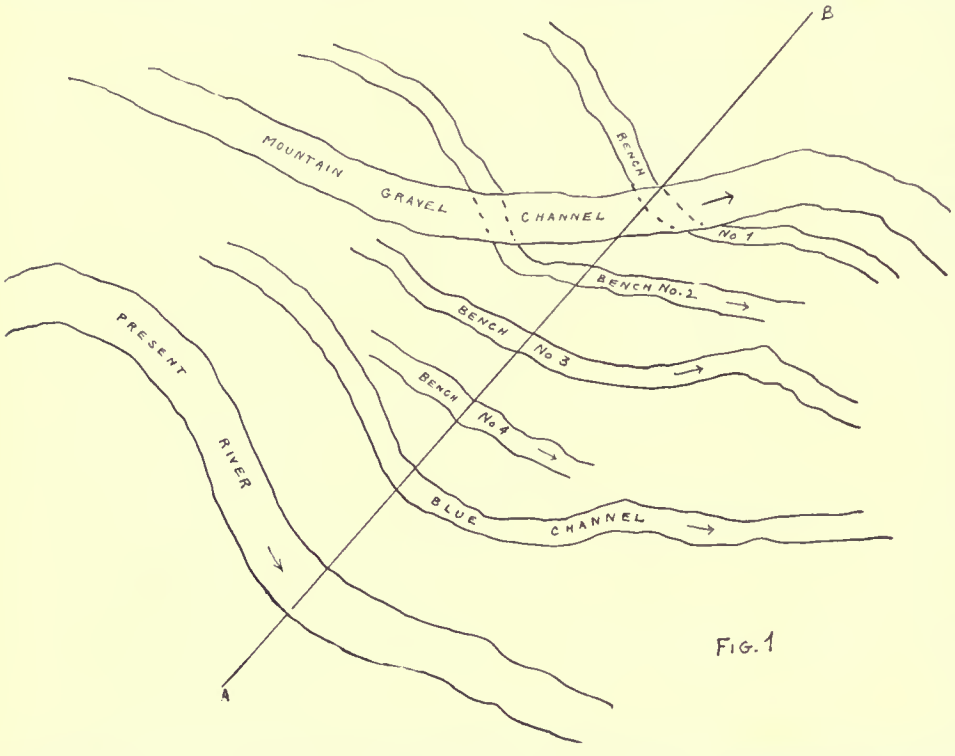


FIG. 1

Many of the last were thinkers, readers, and observers, who did their observing and some thinking while working in these channels, and their reading at night in their cabins. These same men have noted a great many facts and originated some of the most plausible theories concerning these ore deposits.

Some of the late writers on the subject have divided the time that has elapsed since the first streams of the Neocene period into several sub-divisions. While it is true that there were several flows of lava, with long intervals between, it seems unsatisfactory to divide into periods the time these streams were cutting their channels down through each sheet of lava and deeper into the bedrock each time, until the final flow that caused the streams to seek new channels along its marginal edges. The mere separation of the time into periods is not of practical importance to the miner or prospector.

During the time when the now extinct and lava-capped rivers were living streams, the eastern boundary of California was marked for a long distance by the lofty chain of the Sierra Nevada, the general trend of which was west of north and east of south. On the Pacific slope of these mountains there was a series of parallel low ridges and valleys of gradually decreasing altitude until the whole formed the eastern shore of a shallow sea, now occupied by the two great valleys of the Sacramento and San Joaquin. Descending this western slope at this time were a number of rivers cutting their way through these successive ridges, which were composed of mineral-bearing formations; these rivers concentrated and deposited the valuable minerals along their beds, while the debris was carried forward into the sea. After the streams had cut cañons of considerable depth extending far back into the mountains, there occurred a period of volcanic activity in the Sierras, and large quantities of lava flowed down the cañons, partly filling them. After this first lava, which was in most places a rhyolite mud, had ceased to flow, the streams began to cut through it, their beds being now much wider than they were before; consequently, there was not water enough to cover the entire surface and this resulted in the streams being diverted from one side to the other at many places, causing them to cut the new and deeper channels in the rims of the older beds at many points, leaving opposite these places portions of the latter with their covering of rhyolitic mud; this covering, having escaped subsequent erosion, is discovered by the miner ages afterward, being what he terms "the upper benches covered with pink lava." After a long period of quiescence, the volcanoes again became active, sending out a second flow of rhyolite mud, which filled the new channels many feet deep. During the inactivity following this flow, the streams

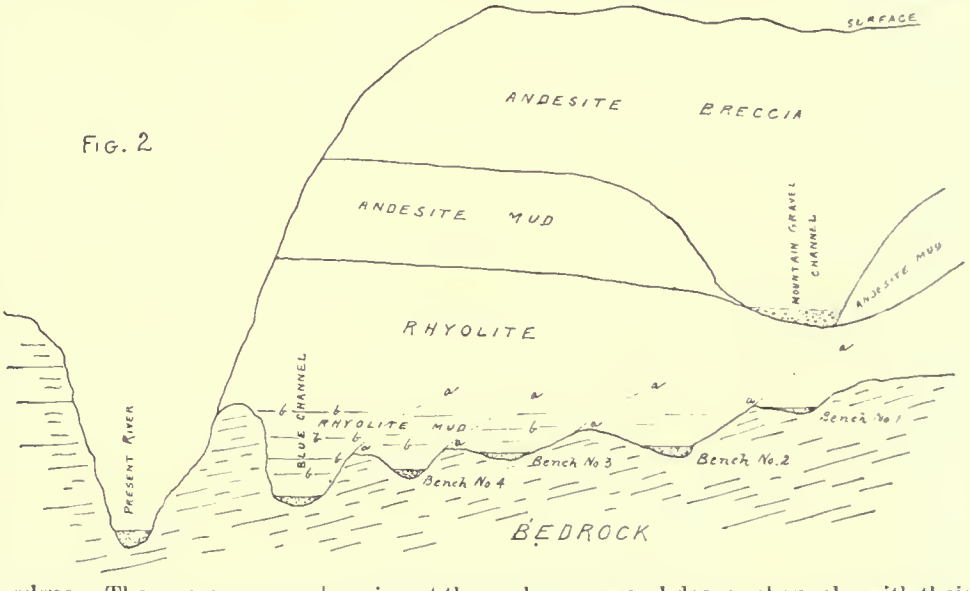

FIG. 2

again cut themselves new and deeper channels, with their resultant benches, as they did formerly, the benches of this period being lower than those of the first. That there were within the drainage-area of some of these streams four different lava flows, followed by the streams cutting themselves new and deeper channels before the 'deep' or 'blue channels' were formed, is proved by the existence of benches at four different elevations, as illustrated in Fig. 2.

The 'deep' or 'blue channels' are the latest of the lava-capped series, as they are cut deeper into the bedrock than the lower benches. The streams then had much

narrower beds than at any other period in their existence, as they cut into the bedrock several hundred feet in forming the blue channels. Then the volcanoes became active again, ejecting a somewhat different material from that of their former ejections. It became much harder on cooling, and on erosion it gave the boulders, cobbles, pebbles, and sand, which, with a smaller quantity of vein-quartz and bedrock-boulders, constitute the gravel of these deep channels, while the gravel of the benches consists entirely of smoothly washed boulders, cobbles, pebbles, and sand of white and blue quartz and some of the older bedrock series, but no lava except the overlying rhyolite mud.

That the area drained by these ancient rivers was sterile before the forming of the blue channels is evidenced by the absence of vegetable remains in the remaining portions of these stream beds known as benches. In the former there are large quantities of drift-wood, trees are found, also the decayed and charred remains of grasses that grew along their shores. Some of the trees and bogs are several feet in diameter, giving evidence that there was a long period of time between the flowing of the streams on the lowest benches and in the deep channels. During this time the volcanoes were in a state of rest, which was finally broken by a long and almost incessant period of activity, as indicated by the material now found, filling the cañons of these ancient rivers and their tributaries. The filling is generally lava of the last-mentioned character (rhyolite) reaching well up to the original surface of the older bedrock, with several strata of sand, water-worn pebbles of the same material, and quartz. On top of the last of the rhyolite-flows in many places, there was deposited a final flow of andesite mud (the miner's 'cement') many feet thick, which was of such a consistency that it formed an anticlinal, diverting the water of the tributaries to the marginal edges on the respective sides of the main streams. When the volcanoes had ceased their flow of andesite mud, these streams began to cut into the andesite along its edges, making new channels in which were deposited gravel and sand from the erosion of this andesite, forming the miner's 'mountain gravel.' While the streams were flowing in these later channels, there were several light flows of andesite mud and lava, which formed barriers to the cutting down process by diverting the streams toward the centre of the andesite plains, as it then appeared. Finally at some of the volcanoes, there was an eruption of a large quantity of mud and fragmental andesite; at others there was emitted basaltic lava, which flooded the larger part of the western slope of the Sierras, covering the whole area excepting the high bedrock peaks and hills. These enormous floods of andesite and basalt, at points high up in the mountains, diverted the streams to the north and south, and gave them a greater grade, which augmented their cutting powers for forming new channels. After a period of time that appears inconceivably long, we have the deep cañons and gulches of today, reaching deeper into the original bedrock than the Neocene deep channels.

If we could view all of the western slope of the Sierras drained by the streams that are tributary to the Sacramento and San Joaquin rivers, we would see those streams flowing in the bottoms of deep cañons, with steep and rugged sides terminating upward in high ridges; these ridges are lava-capped, and underneath them, in many places, are parts of the Neocene rivers that have escaped the sculpturing of the later channels.

It is my opinion that the deep channels, with their lava boulders, cobbles, and pebbles intermixed with some of quartz and bedrock, now overlaid with lava, are the later of the Neocene channels, and the age of the benches within the troughs of these channels accord with their elevation above the latter, that is, the higher above the deep channel the bench is, the older it is; further, that the benches are always void of gravel composed of the late lavas; that there is always a line of demarkation between the rhyolite mud overlying the gravel of the benches and the later lava-filling of the deep channels; and, finally, that benches may occur on either side of the deep channels and at any elevation above the bed of such channels. I venture to recommend the mapping of the workings in the deep channels, that their course may be ascertained, so as to guide the work of finding the lower benches, and if these are also mapped, then data will be obtained for exploratory work among the higher benches.

IQUITOS AND WESTERN PERU. — There is no rapid means of transportation between Iquitos and western Peru, and persons who travel between the two districts are obliged to make the trip by water, via Para, Brazil, which requires from two to three months, or to take one of several overland routes, which require from 30 to 60 days, according to delays experienced in obtaining mules, canoes, guides, etc., at the different stops along the journey. That there will before many years be communication by steamer and rail between these two parts of Peru there can be little doubt. In northern Peru an American company has obtained a concession for the construction of a railroad from the Pacific Coast to a point on the upper Maranon river to which navigation from Iquitos is possible.——In southern Peru the Government is at present actively engaged in surveys and preliminary preparations for a railroad from Oroya, a point on the Cerro de Pasco railway, to the navigable portion of the Ucayali river in eastern Peru. This road will be about 320 miles long, principally through a rough mountainous country, which presents many difficult engineering problems, all of which, however, it seems can be overcome. The work commencing at a point about 15 miles from Oroya, on the Cerro de Pasco railroad, and extending to a point on the Ucayali river, navigable the year round to the launches which ply out of Iquitos, has been divided into six sections and assigned to separate engineering parties. An American has charge of the first section of 100 miles, while German and Peruvian engineers have charge of the other sections. The party in charge of the work of the sixth section left Lima in April, 1906. They completed their work and arrived in Iquitos December 28; the engineer of which is also authority for the statement that, while there are several points that will require a vast expenditure of labor and capital to overcome, the entire route as proposed is feasible, and the construction of the road is practically assured; in fact, it is planned that active building operations will be commenced during the present year.

THE quality of the deposits of monazite sand now being worked in Brazil is not as good as it was formerly. It is not so rich in thorium and is more difficult to secure. So long as the tax on the sand remains at the former figure, and while the percentage of thorium is decreased, there is in fact an actual increase in the tax on thorium, the valuable constituent of the sand. Taking the Brazilian fields as a whole, this decrease of richness and corresponding increase of taxation has been considerable. Exporters of the sand say that they can do no business in the United States because the present tariff of six cents per pound is, at 5% of thorium, an actual tax of $1.20 per pound, and is practically prohibitive for them. The exports of the sand from Brazil in 1906 were 4,351,600 kilo. (kilo.=2.2 lb.), valued at $480,813, as compared with 4,437,290 kilo., valued at $485,184, in 1905.

Acid Flotation Processes at Broken Hill.

Written for the MINING AND SCIENTIFIC PRESS
By F. H. JACKSON.

The Broken Hill ore assays, on an average, 16% lead, 15% zinc, and 11 oz. silver. Until a few years ago, of these metals only 65% of the lead, and between 45 and 50% of the silver were saved, but of late, every year has brought an improvement, and it is claimed that by newly patented processes, a recovery of 80% of all the metals is possible, but at the present time roughly 75% of the lead, 70% of the zinc, and 60% of the silver are being extracted. In the meantime, dumps aggregating 6,000,000 tons, assaying 6% lead, 6.3 oz. silver, and 19.1% zinc, have accumulated.

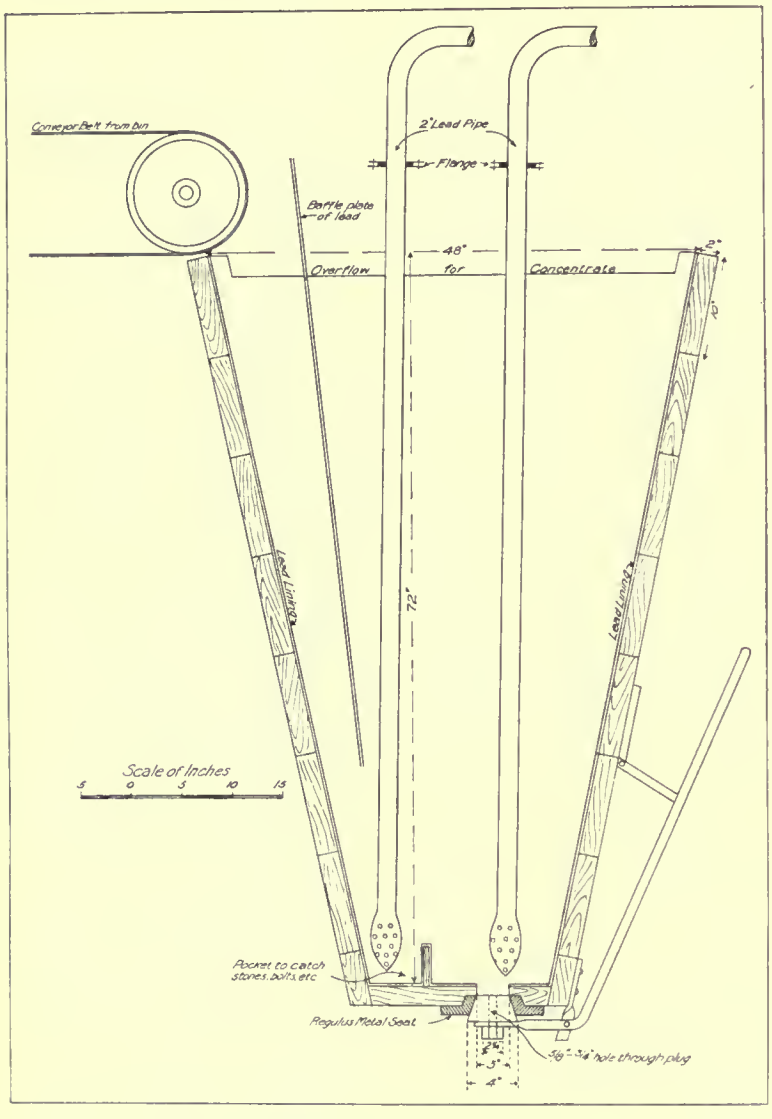

Fig. 1. Pan Used in Acid Flotation Process.

The ore consists of an intimate mixture of galena, blende, rhodonite, garnet, quartz, and calcite. The galena, of specific gravity 7.5, being practically lead sulphide, is easily separated by jigs, tables, and vanners, but the blende (sp. gr. 4) being of practically the same specific gravity as rhodonite and garnet, cannot be concentrated into a pure product by any method based on gravity, consequently the tailing from the lead concentrating mills consists of a mixed product of blende, garnet, quartz, rhodonite, and calcite. Moreover, the blende occurring in the Broken Hill lode is impure, carrying large amounts of isomorphous sulphides of iron and manganese, and will not assay more than about 52% zinc as against a theoretically pure blende of 67%, so that in concentrating the blende from the tailing it is difficult to obtain a product of more than 40 to 45% zinc.

Many processes, wet and dry, have been patented, whereby the blende may be separated from the gangue. The dry are chiefly magnetic processes, but as this paper only intends to deal with the acid flotation processes, a comparison of the different methods will not be attempted.

The Potter and Delprat patents are both for 'acid flotation' processes and both depend on the power of an acid solution to float the particles of zinc-blende on its surface, from which they may be mechanically and continuously drawn off. Both processes are practically the same, and the same type of plant required for each, but while a weak acid solution is all that is required in Potter's method, the Delprat process requires the use of salt cake, which, it is claimed, increases the specific gravity of the solution and therefore its floating powers. This salt cake is acid sodium sulphate ($NaHSO_4$) and is a by-product in the manufacture of sulphuric acid at the Proprietary Company's works. Whether it is of any material benefit is doubtful, as the specific gravity of the solution is in any case greatly increased by the amount of sulphates in solution. Both processes use sulphuric acid simply on account of its relative cheapness. The Potter process was the first in the field, and the company controlling the nt has become involved in an action against the Broken Hill Proprietary Co. using the Delprat process, alleging that the latter is a violation of patent rights.

The strength of the acid solution used depends on its heat, and on the alkalinity and freshness of the tailing treated; it varies from 0.5 to 1.5% H_2SO_4. Very old tailing, and that which has become oxidized, consumes more acid than would be required to treat it as it came from the lead concentrators, in dissolving the incrustations from the faces of the blende particles before concentration by flotation can take place. The heat of the solution is a most important factor; it should be kept as high as possible, and not lower than 80° C. Testing of solution in the pans for heat and acidity should be frequent throughout the shift, the latter being tested by titration with normal sodium hydrate, using methyl orange as an indicator. Material between a 40-mesh and an 80-mesh screen was found to be the best in size for treatment, and old tailing should be sifted through coarse screens to extract stones and other rubbish, which cause trouble in the pans. In any case, a division is made at the bottom of the pan to prevent this rubbish from blocking the plug-hole (Fig. 1). What actually happens in the pans is a little obscure, but the following is an approximation. The calcite and other carbonate particles in the tailing, together with the iron in the blende, are at once attacked by the acid, and bubbles of CO_2 and H_2S are respectively formed. For some reason, the bubbles of CO_2 leave the calcite, etc., and attach themselves to the bubbles of H_2S surrounding the particles of blende, thereby causing these to float to the surface of the liquor; the flow of liquor carries the blende and bubbles into boxes, where, on the bursting of the bubbles, the blende particles sink and are drawn off. The quartz, rhodonite,

etc., in the gangue sink to the bottom of the pan without hindrance and are tapped, the process being continuous.

The following is the practice in the Block 14 mill, at Broken Hill, using the Potter process: Acid of about 90% H_2SO_4 was bought by the ton, and stored in a lead-lined square wooden vat about 10 by 10 by 8 ft., securely braced by iron rods on the outside. From here it was run by a two-inch leaden pipe into the solution vats as required to keep the solution up to the right strength. These pipes should be under cover or protected in some way in cold weather owing to the pure acid freezing at a comparatively high temperature. The solution vats were also square lead-lined wooden vats about 12 by 12 by 12 ft. Round vats would have been better owing to the tendency of the lead lining to split at the angles in the square vats, thus causing leakage and considerable damage. Steam jets were introduced to keep the solution at boiling point, 80 lb. pressure being used, but of course superheated steam would have been cheaper. The solution ran from these vats to the treatment-pans, the flow being controlled by regulus metal valves. Trouble was caused by chips of wood and other floatable rubbish being pumped up with the solution at the tail end of the mill into the storage vats and choking them. Screens were tried over the openings of the pipes inside the vats, but the various sulphates in solution formed a white incrustation and choked them rapidly. On the occasions mentioned, a mat, attached to a length of copper wire, had to be lowered into the vat to cover the pipe-opening, the valve taken off, both it and the pipe cleared, and replaced. Two pipes ran to each pan and were interchangeable from vat to vat. The last seven or eight feet were separate lengths of pipe, closed at the end, but bulged and punctured round the bottom to give free passage of the solution into the pan. These lengths had to be removed on an average once each shift to clean out the chips blocking the holes.

The treatment pans (Fig. 1) were lead-lined pyramidal boxes, 6 ft. deep inside, 4 by 4 ft. at the top and about 18 by 8 in. at the bottom, constructed of 2 by 10 in. oregon pine, and braced with iron rods from side to side on the outside. A seat was bolted on the bottom of the pan, in which a plug was fitted operated by a lever to let out stones, etc., blocking the opening. These seats and plugs were cast at the mine from regulus metal (90% Pb and 10% Sb). The life of a plug was about 48 hours, the original ⅝-in. hole being worn to about 1¼ in. during that time; it was then replaced by a new one, and used to re-cast others. The material treated, consisting of old buddle-tailing, was fed into the pans by conveyor-belts. A baffle-plate of lead was fitted into each pan and extended half-way down, so that the feed had to pass almost to the bottom of the pan before the zinc could rise on the other side. In this way, only slime in suspension in the solution overflowed with the blende. Two pans were used, and each averaged eight tons per hour for several months. The solution flowing in through the openings in the pipes at the bottom of the pans had to be of such an amount as to keep a good overflow, while continuously discharging the tailing through the plug at the bottom. A hopper with an overflow launder caught the tailing, from which it was tapped into trucks (See Fig. 2). The trucks were a continual source of trouble owing to the acid attacking all the ironwork, bolts, wheel-flanges, rails, etc., and better results have been obtained by discharging the tailing with as little moisture as possible onto a conveyor-belt and draining it into a sump. The overflow from the pans carrying the blende, ran down lead-lined V-shaped launders into a hopper, plugged at the bottom like the pans, and giving a continuous discharge of blende into the trucks below. A small amount of slime got away with the blende at this stage, but in later practice a cone-separator was introduced below the zinc-box, from which the blende was discharged into trucks as before, and the slime overflowed to Wilfley tables to extract any blende remaining in it. The overflow from the zinc-box carried away most of the slime, which was caught in a long settling-box, and afterward treated on a Wilfley table. A centrifugal pump, running submerged, raised the solution from the last compartment of the settler back to the first solution-vat. This first vat settled any slime

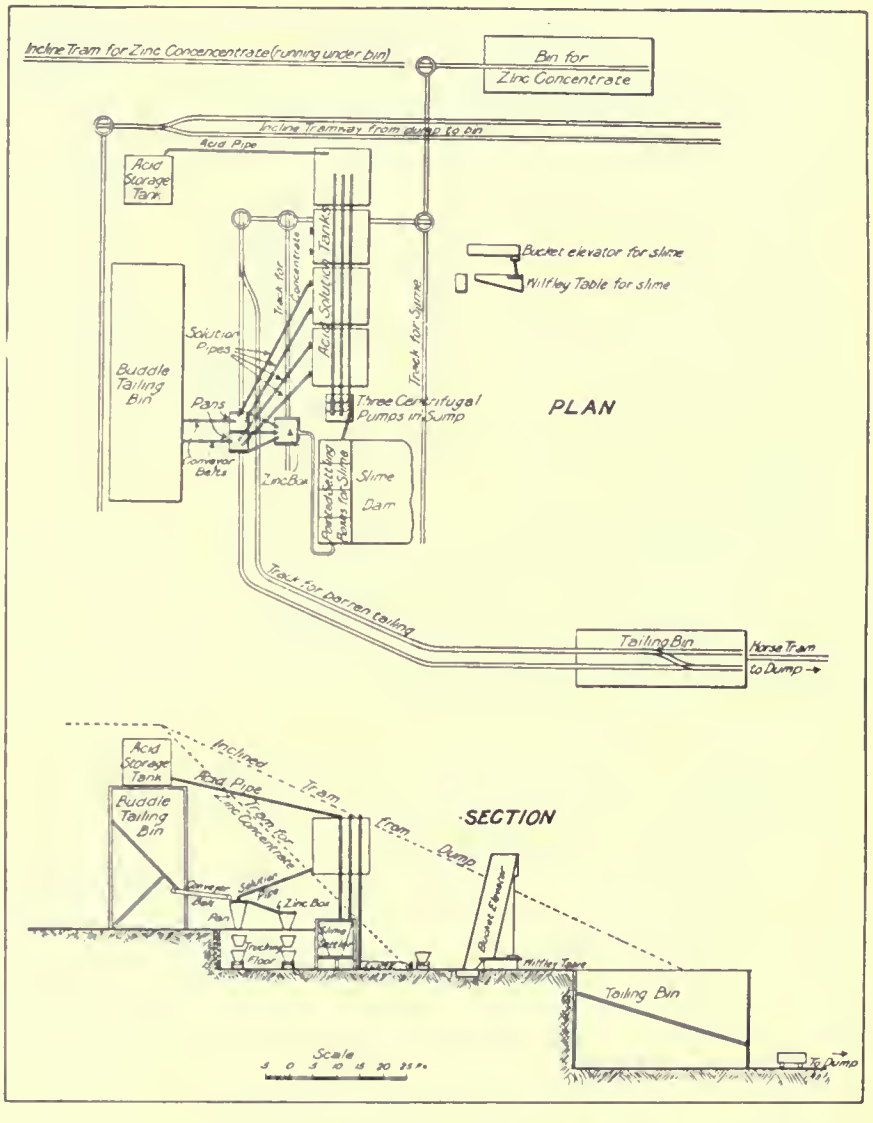

Fig. 2. Plan and Section of Tailing Mill.

remaining in the solution and was never connected to the pans. The pumps were designed and cast at the mine from regulus metal and worked very well when running submerged, but required packing often to avoid leakage of acid on the spindle. Trouble was experienced with those running as suction-pumps owing to the continual leakage of air caused by the acid attacking the bolts, and the difficulty of keeping an air-discharge pipe screwed firmly enough into the regulus metal. Moreover, the slime settled in the sump stiff and hard, and when enough was in to reach up to the valve of the suction-pipe, the pump, of course, would not draw. This latter difficulty was overcome by making the suction-pipe of rubber hose, reinforced by copper wire, and a length of copper wire fastened to the valve at the end enabled it to be drawn up clear of the caked slime, and when not in use, clear of the solution. The pumps required constant attention and an air-lift has been found to give much better results.

The following figures, relating to extraction and costs, represent an average for six months. The buddle material assayed 5.8% Pb, 15.6% Zn, and 6.6 oz. Ag, and from these a concentrate assaying 6.1% Pb, 42% Zn, and 11.3 oz. Ag was made, about one ton of concentrate being produced from four tons of tailing treated. The recovery was about 25% of the lead, 67% of the zinc, and 42% of the silver. Costs were 9s. 8d. per ton of crude tailing, or about 40s. per ton of concentrate produced, divided as follows:

	s.	d.		s.	d.
Acid	3	3	Coal	1	0
Labor, office, and managem't	3	5	Stores		3
Dump contract	1	3			
Water		6		9	8

These costs could be reduced in almost every particular. For instance:

Acid. By being obtained at a lower price than £11 per ton, the consumption was about 30 lb. per ton of tailing treated.

Water. Lower price; 5s. per 1,000 gal. being the price at Broken Hill.

Coal. By the use of superheated steam.

Dump Contract. High price owing to the fact that the buddle tailing had to be shoveled into trucks at the dump, and hauled up an inclined tramway to the bins. This contract also included the loading of the concentrate into trucks underneath the bins, and hauling it up a similar tramway. Conveyor-belts could be used to do this work at one-third the price.

Labor. Expensive owing to trucking. The tailing (barren) was handled twice, first, in trucking to the bin, and second, in shoveling it from the bin to other trucks in which it was taken by horse-traction to the dump.

Except for the trucking only a couple of men were required, one to attend to the pans, and the other to the pumps, shafting, motor, etc. Provided everything went well, the process was continuous and became one of the simplest methods of concentration. Better arrangements could undoubtedly have been made, but the plant started in an experimental fashion, being continually altered, and evolved out of the more primitive methods of treatment; the best had to be made of what there was, the only remedy being, of course, the building of another plant.

THE London *Commercial Intelligence* states that outside of Canada and the United Kingdom, there are no steel works of considerable size in the British Empire. Big works are proposed for India, South Africa, and New Zealand. In Australia works are being constructed in New South Wales, 101 miles from Sydney, where unlimited quantities of iron and coal exist. The capital of the new company is placed at $2,000,000.

Decisions Relating to Mining.

Specially Reported for the MINING AND SCIENTIFIC PRESS.

The lessee of a mine has no title to any specific portion thereof, until mineral of the kind described in the lease is actually produced and severed, so that it becomes personal property. The legal title to, and the possession of, the entire mass and volume remain in the owner of the strata in which it is confined until so severed.

Kansas Nat. Gas Co. *v.* Board of Commrs., (Kans.) 89 Pac. 750. (March, '07.)

There can be no taxation of separately owned mineral rights, except when the right or title to minerals in place has been severed from the right or title to the remainder of the land, and has become vested in a person other than the one having the right or title to the remainder of such land. When the statute applies, the right or title to minerals is taxed as realty.

Kansas Nat. Gas Co. *v.* Board of Commrs., (Kans.) 89 Pac. 750. (March, '07.)

Where the mine-boss, the blacksmith, and two miners occasionally rode in a car used for hoisting ore; and where the mine-boss directed miners not to use the car; and where the mine was equipped with a system of ladders, well lighted, kept in good order, and commonly used by the employees in going to and from the mine, it was held that such car was not an appliance furnished by the master to be used as a passenger-elevator.

Burns *v.* Old Sterling Co. (N. Y.), 80 N. E. 927. (April, '07.)

The lessee of a gas and oil lease failed to drill a well within the time stipulated, and the lessor served notice on the lessee that he would not accept any renewal, and demanded that the work be begun and pushed to completion. On failure of the lessee to comply with the lease by drilling wells as required by its terms, the lessor was entitled to a cancellation of the lease.

Puritan Oil Co. *v.* Myers (Ind.), 80 N. E. 851 (April, '07.)

In an action against an adjoining land owner for damages for taking coal from the plaintiff's land, it was agreed that the defendant should take coal from under the plaintiff's land, and give a bond to account therefor in case the plaintiff succeeded in his action. On the trial of the case the boundary was determined in favor of the plaintiff, and it was held under the bond and the agreement that the defendant was only liable to the plaintiff for a reasonable royalty on the amount of coal removed.

Sandy River Coal Co. *v.* Whitehouse Coal Co. (Ky.), 101 S. W. 319. (April, '07.)

In an action for damages for unlawfully working a mine and taking coal or ore therefrom, the rule is that if the taking was not a wilful trespass, but was the result of an honest mistake as to the true ownership of the mine, the measure of damages is the value of the coal or ore as it was in the mine before it was mined.

Sandy River Coal Co. *v.* Whitehouse Coal Co. (Ky.), 101 S. W. 319. (April, '07.)

An injunction may be granted to prevent a threatened assault to a claimant and his employees, in case they appeared upon or undertook to do any work upon a claim, pending an action to determine the right of possession and ownership of certain mining ground. Such injunction may prevent the defendant, his agents and employees, from in any manner interfering with the plaintiff and his employees, in performing necessary discovery work and other work upon such claim necessary to hold the same, although all the allegations of the plaintiff's complaint were denied by the defendant.

Safford *v.* Fleming, (Idaho) 89 Pac. 827. (April, '07.)

Gold Tellurides.

Written for the MINING AND SCIENTIFIC PRESS
By W. J. SHARWOOD.

Attention was recently called, in the editorial columns of this journal, to the occurrence of tellurium with the gold ores of Goldfield, Nevada. The accompanying drawings of thin sections show two modes of occurrence of these ores, and form a supplement to the illustrations given in the issue of January 26. With them are included two others of gold-telluride ores from Kalgoorlie, Western Australia. The black areas indicate dense metallic gold.

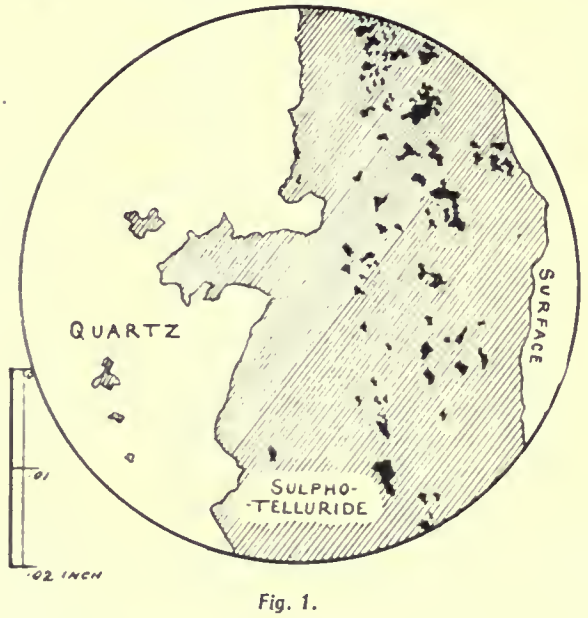

Fig. 1.

Fig. 1. A small specimen, said to come from the Mohawk mine, consisted of a mass of quartz or silicified porphyry, containing some fine scattered particles of pyrite and telluride, and having one face covered with a thin layer of a black mineral. This black material gave strong reactions for sulphur, tellurium, copper, and iron, also for arsenic, antimony, gold, and silver (about 6% and 1%, respectively, of the two last)—a composition agreeing with the admixture of tetrahedrite and telluride suggested in the editorial referred to. To all outward appearance, however, the material seems to be uniform in character, and gives no evidence of being such a mixture. A section was cut across the black layer, which did not exceed 0.05 in. thick, and is shown, highly magnified, in Fig. 1. Free gold is seen lying in the mass, in small and irregularly shaped particles, which show a tendency to arrange themselves in layers parallel to the surface. The gold is between 850 and 900 fine. The assays quoted by Lochiel King of the famous shipment of Mohawk ore indicate a fineness of about 890, if the total gold and silver in the ore are considered.*

Fig. 2. A second specimen of silicified porphyry from the Goldfield district had a brown streak, half an inch wide, running across it. On close examination, the color was found to be due to very fine particles of gold, thickly strewn through the rock, and forming 5 to 10% of the bulk, and one-quarter to one-third of the weight, of the brown portion. This gold was very dense, becoming brilliant when cut or ground down, and was of remarkable purity, being over 996 fine, or worth $20.60 per ounce. In certain patches a telluride occurs in irregular particles like the gold, or mixed with it. There was too little to allow of an analysis, but in appearance it resembles sylvanite.

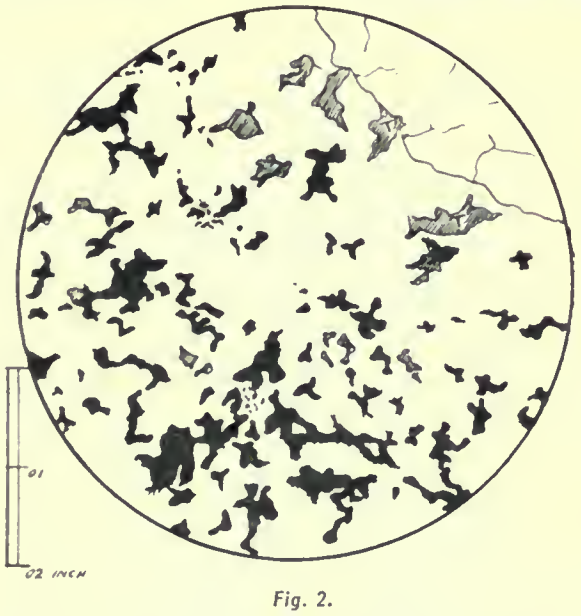

Fig. 2.

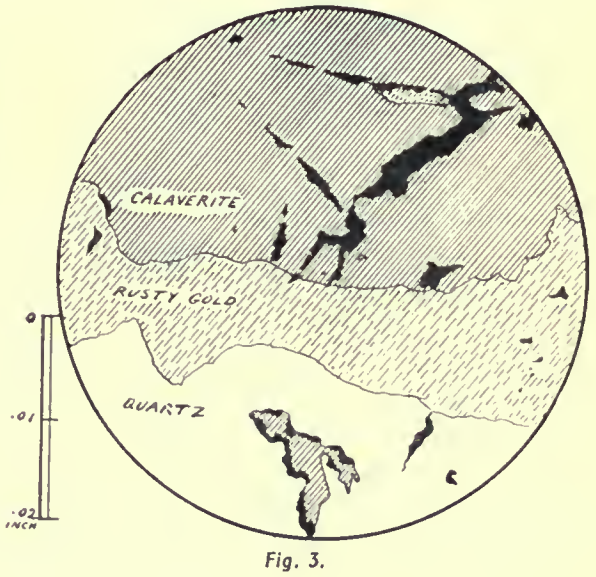

Fig. 3.

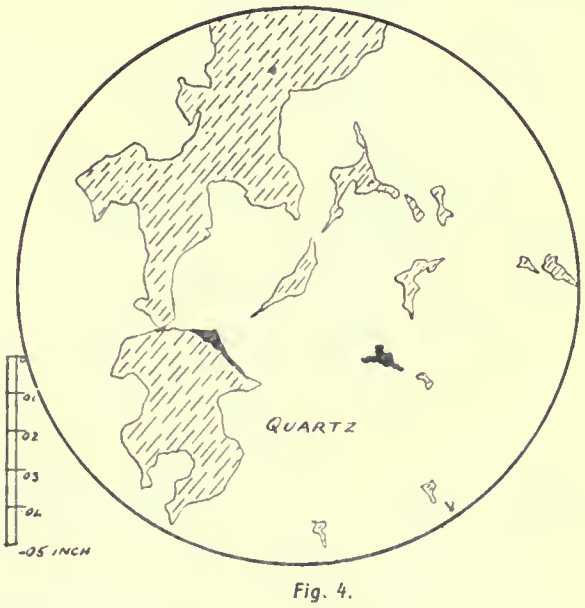

Fig. 4.

Fig. 3 and 4. In contrast with the preceding are two sections of telluride ore occurring with quartz in a greenish schist from Kalgoorlie. The calaverite, of which Fig. 3 is a section, was in rather large masses, and

*MINING AND SCIENTIFIC PRESS, February 23, 1907.

appeared bright and fresh. Under the microscope it showed fine streaks of brilliant yellow gold, many of them in straight lines, and at the border was a dull yellow or brownish band, which proved to be due to finely divided gold in a spongy, soft, and almost earthy condition, but which became bright when burnished by rubbing or annealed by heat. It was like mustard-gold, and could only be amalgamated with great difficulty. It had evidently been liberated by oxidation of the telluride, but without uniting into the dense brilliant form usual in vein gold. Fig. 4 shows a similar specimen, in which the telluride has entirely disappeared, and masses of spongy and rusty gold remain.

The Geology of Japan.

By Robert Anderson.

*The ground-plan of the Japanese islands was laid during the earliest geological times, Archean gneisses and schists and a great thickness of Paleozoic sedimentary, metamorphic, and igneous rocks being the basement complex. Mesozoic, Tertiary, and Quaternary formations are wide-spread and diversified, having the character of a superstructure over an older land mass. The island chain is continental in character, not chiefly of volcanic origin, although volcanic activity has always been a feature of its history. It is a country of long-continued and great geological activity, as shown by the variety of its rocks, by the presence of a thick column of strata representing the earliest and latest as well as intermediate times, by the metamorphism and excessive disturbance of these strata as the result of repeated movements, by the presence of many igneous intrusions and volcanic remains which show that similar igneous forces as are at work today have always been active, and by the modern land-movements forming depressed broken shore-lines and terraces and keeping a fairly new face on the topography of areas occupied by the oldest rocks, these movements being illustrated in the every-day earthquakes to which Japan is subjected.

In a number of points a similarity exists between the geology of Japan and that of the western coast of America: In the existence in both California and Japan of a somewhat similar thick basement complex; our Franciscan is probably Jurassic in age; the Japanese terrane with which it might be compared is supposedly Paleozoic; both formations are intruded by similar serpentine of Jurassic or Cretaceous age. In the apparent Mesozoic age of the wide-spread and important intrusions of granite. In the similarity of the old and recent faunas and floras, as has been partially brought out by a few paleontologists. In the presence in both countries of a large amount of schist formed of the blue amphibole glaucophane, whereas it is rare in all but a few places elsewhere. In the fact that both countries have been long coastal belts of volcanic activity during Tertiary and Quaternary times, the thickness and wide extent attained by the Tertiary tuffs in Japan being remarkable. In the recency of earth movements, as shown in the multitude of earthquakes, the presence of upraised Quaternary deposits and marine terraces, and by the evidence of present oscillations in the level of the coasts. And the resemblance holds good particularly in the tremendous land-building activity of the Tertiary on both sides of the Pacific, contributed to by tectonic movements and the rapid denudation of land-areas and deposition along narrow belts. This feature is illustrated by the great thickness of the Tertiary formations, their structural disturbance, and their lithologic alteration.

*Abstract of paper read before the Geological Society of Washington. *Science*, May 24, 1907.

The Prospector.

Enquiries sent to this department are answered free of charge, if submitted by subscribers who are not in arrears. The full name and post-office address of the sender must be given, otherwise no answer will be made. Those who are not subscribers must accompany their questions with a fee of $3 for each question. No assays are made.

A. B. G., of Oracle, Ariz., sent a fragment of Ilmenite.

A piece of tin, or Cassiterite, was sent by T. L. L., Idaho.

A bit of Barite was sent from Hammil Station, Cal., by F. C.

The Zinc mineral sent from Scranton, Utah, by R. F. B., is Calamine.

A piece of specular Hematite was sent from Sulphur Springs, Colo., by G. H. H.

A piece of Quartz carrying pink Tourmaline was sent by C. L. B., of Temecula, California.

The minerals sent by C. F., of Dayton, Nev., are black specular Hematite and bluish green Opal.

J. R. R. sends from Tres Piedras, New Mexico; No. 1, metamorphosed Conglomerate; No. 2, black Quartzite; No. 3, Rhyolite; No. 4, Rhyolite.

D. T., of Iron Springs, Idaho, sends: No. 1, Limonite; No. 2, Quartz and Pyrite in an altered rock; No. 3, Andesite; No. 4, Epidote and Quartz.

The specimens sent by A. E. P., of Lucin, Utah, are: No. 1, brown iron-stained Calcite, with a black mixture of Calcite and Clay Gouge; No. 2, Calcite, Limonite, and Quartz; No. 3, Schist.

The black sand sent from Sacramento, Cal., by B. W., contains Magnetite, Ilmenite, Zircon, Quartz, Garnet, etc., with a little Copper, Gold, and Platinum. The other specimen is Quartz.

The specimens marked A. B. C., New Mexico, are: No. 1, Andesite; No. 2, Limestone; No. 3, Quartzite; No. 4, Specularite, Limonite, Quartz, and Calcite; No. 5, Clay Shale; No. 6, Limestone.

The specimens sent by B. N. S., from Stevens county, Washington, are: No. 1, Andesite; No. 2, Andesite; No. 3, Andesite; No. 4, quartzitic Breccia, cemented by Calcite; No. 5, Quartz, Calcite, Chlorite, etc., and probably an altered Andesite; No. 6, Chert.

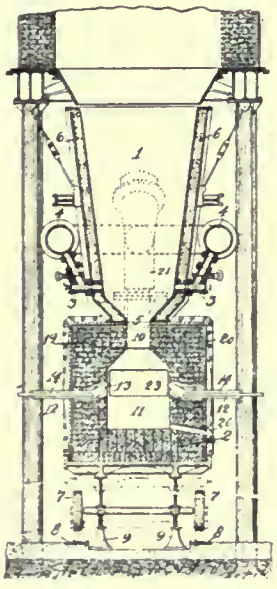
S. O., of Windham, Alaska, sends: No. 1, Schist with Sulphides, and may carry Gold or Silver; No. 2, Mica Schist; No. 3, dolomitic Limestone; No. 4, Hornblende Schist; No. 5, Hornblende and Chlorite; No. 6, Pegmatite Granite; No. 7, Quartzite; No. 8, Mica Schist.

Iron and Steel Industry in Australia.—From Melbourne comes the report of the formation of two companies, one with a capital of over $2,500,000, for the manufacture of iron and steel in Australia. One company is to operate at Lithgow, in the State of New South Wales, where large deposits of magnetic, hematite, and other iron ores, together with coal and limestone, are said to exist; the other is to be located near Melbourne, the ore being brought from the Tamar river, Tasmania. In both cases large plants are to be erected. These companies are the first serious attempts to establish the iron industry in Australia, though the local manufacture of at least sufficient iron and steel for the requirements of the Commonwealth has long been advocated by those interested in the subject.

MINING AND METALLURGICAL PATENTS.

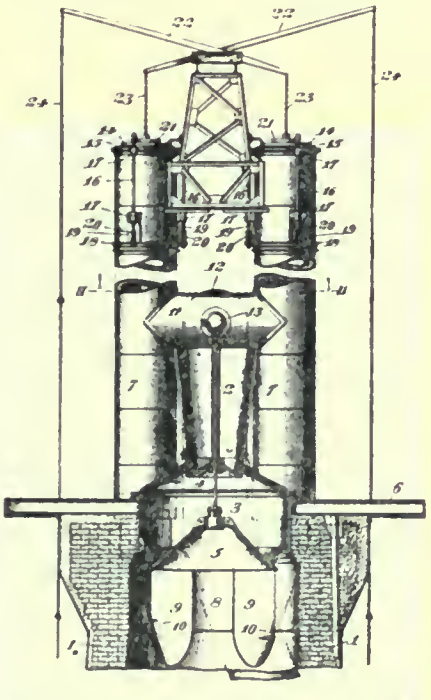
Specially reported for the MINING AND SCIENTIFIC PRESS.

SMELTING-FURNACE.—No. 852,613; Walter G. Perkins, San Francisco, California.



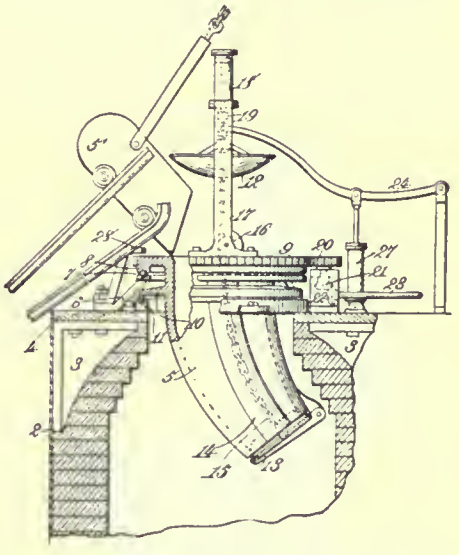
In a smelting furnace a hollow structure formed in two sections, the lower end of the upper section being contracted and provided with an opening, and the lower section being provided with a chamber which communicates with said opening, means for introducing a blast of air into the upper section above the contracted portion, means for connecting said air introducing means with the chamber of the lower section and means for introducing an inflammable gas into the chamber of the lower section.

BLAST-FURNACE TOP.—No. 851,128; John W. Gocher, Johnstown, Pennsylvania.



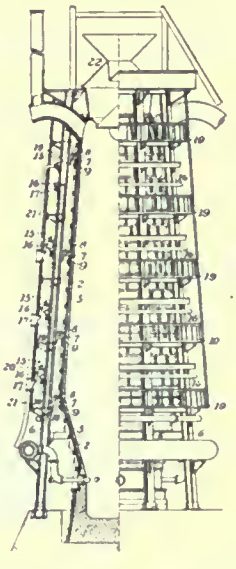
In a blast-furnace the combination with the stack, of an explosion-chamber of large diameter to thereby maintain low gas-velocity therein; located substantially in line with the wall at one side thereof and extending vertically far above the same, a charging-hopper, a port below said hopper having a steeply-inclined bottom connecting said chamber with the interior of said stack and a down-comer connected with said chamber intermediate of its ends and at a point a considerable distance above the top of said stack.

BLAST-FURNACE-CHARGING APPARATUS.—No. 853,016; Guy R. Johnson, Clarksville, Tennessee.



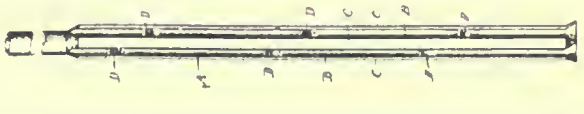
The combination of a blast furnace, a revoluble spout extending into said blast furnace, a valve hinged to the lower end of the spout, chains connected with the valve, pipes carried by the spout through which said chains extend, means for operating the chains in a direction to close said valve to cause it to support a mass in the spout, said valve when opened serving to release said mass, and a second valve supported independently of the spout and closable against the upper end thereof above the mass therein and to constitute a seal for said spout.

STACK-FURNACE CONSTRUCTION.—No. 853,698; Joseph L. Hunter, Roanoke, Virginia.



A stack-furnace of varying cross-sectional areas at different levels having above the mantle a metallic jacket composed of annular sections, and exterior structural framework around the furnace supporting some of said sections.

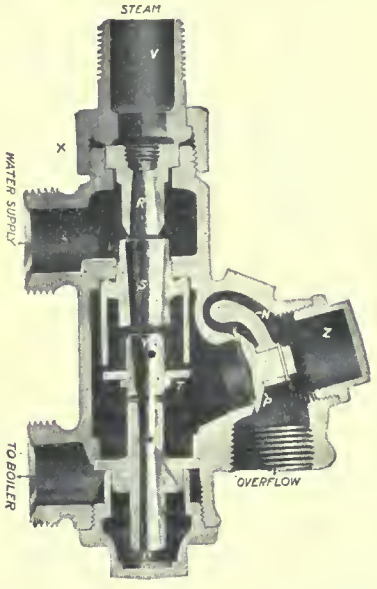
ROCK-DRILL.—No. 847,587; Bradford H. Locke, New York, New York.



A rock-drill having a longitudinal channel and a series of lateral openings therefrom at frequent intervals along its length back of the drill-head, whereby the drill can be successively sharpened without closing the openings other than that next the head.

Penberthy Automatic Injector.

The Penberthy Automatic Injector is a perfect re-starting automatic machine. By this is meant that when the injector is working, if the current of water be suddenly interrupted, as is liable to happen from a sudden jar or jolt (on such apparatus as traction engines or road rollers or in

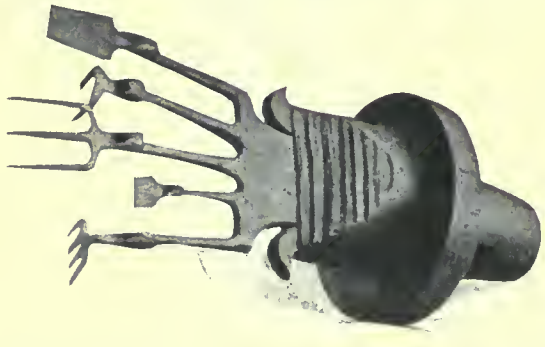


case of a marine boiler by the rolling of the vessel) this injector will automatically re-establish the current without attention from the attendant. The Penberthy is so constructed as to have but few wearing parts and will last for years with proper care without renewals. All parts are interchangeable, however, when required.

The Penberthy Injector Co., of Detroit, Michigan, are pioneers and the largest manufacturers of automatic injectors in the world.

Commercial Paragraphs.

THE ARTHUR KOPPEL CO. is distributing an attractively illustrated booklet descriptive of the Arthur Koppel Forged Steel Shoes and Dies. As a proof of the excellence of the steel produced in making these shoes and dies the company



exhibits an illustration, herewith reproduced, of a shoe, the body of which has been forged into miniature tools. From this special forged steel the Koppel Co. also makes all accessories for shoes and dies, cams, tappets, bore-heads, roll-shells, crusher-plates, rollers and forged rings for the Huntington mills, base and cast-ring tools for the Chilean mills.

A. L. TAYLOR COMPANY announce that they have succeeded to the business of the late Seymour R. Church, who died a year ago. The plates and copies of his book, 'Analysis of Pig Iron,' were destroyed in the great fire, therefore it is no longer possible to supply orders for this valuable work. The Taylor Company is prepared to answer such enquiries as were formerly sent to S. R. Church; they should be addressed to them at 9 California St., San Francisco.

THE LUNKENHEIMER COMPANY, Cincinnati, Ohio, has established its Eastern office and warehouse in much more commodious quarters, in the building at 66 Fulton St., New York, recently erected. Some conception of the comprehensive stock carried at this depot is afforded by a mention of some of the principal classes of goods made by this company. There are valves for steam, water, gas, and oil; lubricating devices, for ordinary gravity and pressure systems, including cylinder and bearing lubrication, and a complete stock of grease-cups and mechanical lubricators, for auto and high-power motor-boats; likewise a comprehensive line of specially designed cocks and fittings for gasoline piping. In valves there is a stock of bronze goods for high-pressure marine service as large as 8-in. diam. up to 300 lb. per sq. in. There is also a complete line of lubricating devices for gas-engines and air-compressors.

Trade Treatises.

CRANE CO., Chicago, Ill., issues a pamphlet on valves, fittings, and appliances.

MINNEAPOLIS STEEL & MACHINERY CO., Minneapolis, Minn., Brochure No. 101, on the Twin City Corliss Engine.

THE SULLIVAN MACHINERY CO. is sending out a fine 112-page catalogue entitled 'Modern Practice in Air Compression.'

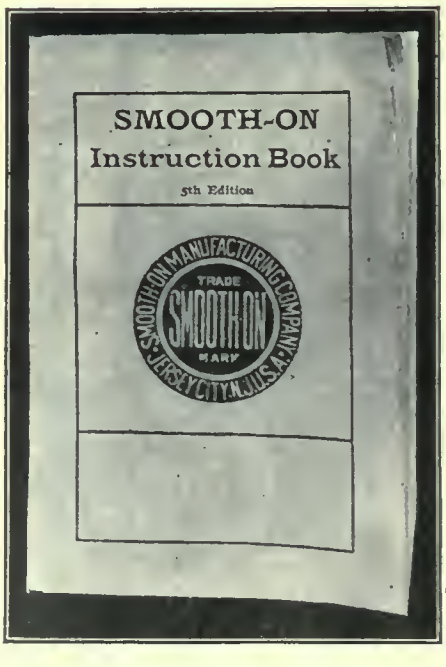
ALLIS-CHALMERS CO., of Milwaukee, Wis., has issued Instruction Book No. 5,009, for the installation and operation of direct-current motors and generators, type K.

CHROME STEEL WORKS, of Chrome, New Jersey, has issued a little pamphlet on 'Chrome Steel Wearing Parts for Cement Grinding Mills.' The Pacific Coast representative is George W. Meyers, Box 135, Berkeley, California.

THE FORT WAYNE ELECTRIC WORKS, of Fort Wayne, Indiana, is sending out Bulletin No. 1,086 on Direct-Current Series Enclosed Arc Lamps; No. 1,091, on Direct-Current Motors; No. 1,092, on Single-Phase Motors; and No. 1,093, on Small Power Motors.

THE JEFFREY MFG. CO., of Columbus, Ohio, has mailed us Jeffrey Bulletin No. 12, a very attractive 80-page publication on 'The Care of Electric Mine Locomotives in Service,' designed to place before the users general instructions for the care and operation, with a description of the equipment, of electric locomotives.

THE SMOOTH-ON COMPANY recently issued the second edition of their No. 5 Instruction Book. This book tells a



few of the many ways in which the different Smooth-On specialties have been used and the results obtained. It is an interesting book and valuable to all manufacturing concerns, especially users of steam. The book will be sent free to anyone sending their name and business address to the company, at Jersey City, New Jersey.

Editorial.

THE NEXT MEETING of the American Institute of Mining Engineers will be held at Toronto, on July 23. A visit will be made to Cobalt, to Sudbury, and to some of the neighboring mining camps.

OUR ENGLISH FRIENDS have good reason to protest against the insufficient postage paid on letters from America. We publish such a protest from Hooper & Speak, a firm of mining engineers not unknown on this side. Owing to the two-cent rate prevailing all over this continent, that is, in Canada and Mexico, as well as the United States, most of us are apt occasionally to forget the higher rate demanded on letters to Europe. We bespeak more care in this matter.

A MOVEMENT is on foot to build a great national gallery of fine arts at Washington and to demand the creation of a department of fine arts, with a Cabinet minister at the head of it. This will arouse some feeling among those that clamor for a Minister of Mines, with a department to represent that industry. Is the first a sly scheme to ridicule the second? Shall we hear next of the need for a department of fishery, with an expert fisherman at the head of it, who shall be a member of the President's cabinet?

FROM A FRIEND at Butte we learn that the wonderful ore in the Receiver mine that was to confound all books on mineralogy is native copper in gouge. It is evidently the result of secondary enrichment, as is also the chalcocite that gives value to the occasional shipments made from that mine. It is a relief to learn that no new mineral carrying 95% copper has been found, for we have a kindly feeling for mineralogists. Native copper will prove just as profitable, and less confounding.

ELY promises to be one of the great copper-producing districts of the world, therefore the article by Mr. James W. Abbott will prove timely. No district better demonstrates the basic principles of mining engineering, the importance of immense deposits of low-grade ore, and the stimulus given by a high metal market. The use of the steam-shovel is a new feature in copper mining and, as at Bingham, it promises to be of great service to Ely. The occurrence of rich mineral in the deeper workings affords evidence of orebodies of extraordinary dimensions and the metallurgical treatment is likely to present many points of interest to the profession.

TIN ORE is so scarce in America, that the discovery near Spokane, described in our issue of May 25, is of particular interest. We learn that a shaft has been sunk 30 feet, exposing a vein 4 to 5 feet wide. The ore assays about 15 per cent, which is high. The impression

is that the deposit will not prove persistent, although 'float' can be found all over Silver hill. There is some scheelite, the tungstate of lime, associated with the cassiterite, and this would render ore-dressing difficult. The latest information concerning this discovery will be found under 'General Mining News.'

ACCORDING to our Butte correspondent some of the larger mines in that important copper district have adopted the policy of extracting the poorer grade of ore while the price of the metal is high, reserving the first-class ore for a rainy day, that is, when copper brings a lower price on the market. This is probably true and indicates an excellent conservatism, but we fear that similar statements will be made by less responsible parties in order to hide the real poverty of some of the copper mines, and to create ideas of valuable reserves that may prove fictitious. Sauce for the goose is not always sauce for the gander, and statements made by the promoters of holes in the ground, must not be accepted as gospel because they resemble those emanating from the Anaconda management. It is too much like the stories of young mines that are expected to pay handsomely because they contain ore like the Homestake or the Alaska-Treadwell, without any evidence that they have the tonnage necessary for an enterprise of similar magnitude.

The Trial at Boise.

THE story of events that are a disgrace to the States of Idaho and Colorado, and a foul blot on popular government in America, has been revived by the sensational accounts of the trial now proceeding at Boise City. Whether William D. Haywood and the other officials of the Western Federation of Miners are guilty, the jury will decide. As regards the testimony of the informer Orchard, there is much that may be said, for it throws a lurid light on many facts previously known to those of us who have been in touch with local conditions in the Cœur d'Alene, in the Telluride district, and at Cripple Creek. The assassination of Arthur L. Collins and the attempt on the life of F. W. Bradley give, to many readers of this journal, a personal interest in the labor disturbances under review. But it means much more than that, for the tragic events have afforded a depressing example of the utter failure of popular government to stamp out lawlessness promptly. It is true that in other countries, such as Turkey and Russia, deeds equally atrocious have been done, even recently, not only despite the Government but often with the connivance of its officials, so that in regretting the inefficiency of popular government in curbing anarchy we simply emphasize the fact that the most advanced form of human association has, in Colorado and in Idaho, proved unable to meet exceptional conditions. The horror felt at Orchard's confession is great, but greater is the resentment excited by the contemplation of a series of stupid crimes perpetrated by an ignorant man; there was no personal ambition to gratify, there was no particular skill exhibited, and there was no real object in it all, save a dull protest against the order of things as they are, and a desire to get a little money. To think that a man like Arthur Collins was assassinated, that another engineer like Bradley was so nearly killed, and that a score of good capable men were brutally murdered by such criminal idiots as Orchard and the like of him, while the States of Idaho and Colorado were spending vast sums of money for the maintenance of a police, a military, and a judiciary that with all their united intelligence were unable to stop a series of such wanton crimes, is enough to arouse the profound anger of any thoughtful citizen. It is the breakdown of what we term civilization.

How was it possible for such deeds to be done, not once or twice, but repeatedly, in Idaho and in Colorado, during a term of fully twelve years? Are the people of the mining regions necessarily more lawless? No. Do the American people favor the methods of Russian nihilists or South American revolutionaries? No. Are the owners of mines in the West more tyrannical, or are the workmen more disorderly than anywhere else? No. What then, it may be asked, will explain this orgy of brutality, this long continued state of anarchy, varied by murder? We venture to attribute it, as we attribute many other ills from which we suffer, in the very midst of a triumphant industrial progress, to the absence of a strong public opinion in support of the law. It is due not to lawlessness but to a lack of civic spirit, of patriotism, of any particular motive save the desire of each man to transact his own business, make money, and go ahead. Because there was no crystallized public opinion to uphold the State officers or to give tone to the county sheriff, therefore when a quarrel ensued between the mine-owners and their employees, there was no adequate assertion of the law and the two parties to an industrial squabble were permitted to develop a vendetta. In consequence, the worst elements in the labor party became arrayed against a few fearless men that refused to accept the dictation of those whom they believed to be neither representative of the laboring men nor acting in good faith. The main body of the workmen themselves was intimidated by a few reckless ruffians. The local government, whether county or State, was either incapable or committed to one side of the quarrel, although the conditions varied from time to time. Thus, in the Cœur d'Alene, the sheriff was a member of the mob that dynamited the mills and the district attorney was a member of the labor-union that was responsible for murderous outrages. The governors were afraid of political extinction if they antagonized the labor party by enforcement of the law, for to do that they would seem to take the side of the mine operators. Steunenberg alone was both fearless and just. He was a laboring man himself and member of a typographical union, but he was a good citizen first and a union man afterward. Even he had to call for Federal aid, the State being powerless. As to public opinion, it is hard to find any; the events occurred in the northwest corner of Idaho in a mountainous region, where 2,000 miners were employed and supported a population of 10,000, of whom 90 per cent

were in sympathy with, or else dependent upon, those that murdered and dynamited. For years the people of the region talked in whispers; the community was perfectly cowed. There was not even the simulacrum of a public opinion. The rest of the State and the country generally did not get the facts or else got them through partisan channels; the affair was represented as a fight between labor and capital, between miners and mining companies. A sensational press prevented sensational events from seeming true; instead of the whole United States being aroused to righteous wrath by such a damnable condition of affairs, a few brave men had to make a desperate fight for law and order, without the momentum of an enlightened public interest to make it instantly effective.

And in Colorado affairs were fully as bad. From ranting politicians, like Waite, that played the game of the labor-unions, to a weak-kneed executive like Peabody, who was dominated by the mine-operators, the State of Colorado during the time of industrial riots happened to have governors unfit to enforce popular government. Peabody allowed the mine-owners to use the State troops, he appointed a leading mine-owner as the Adjutant-General, he acquiesced in the deportation of men and in other lawless acts. And these things were done, perhaps it was necessary that they should be done, because public opinion did not give strength to the ordinary administration of law and a low type of politics had undermined the channels of justice. For the brave men—mine managers, mine-owners, and lawyers—that took their lives in their hands when making an effort to assert their rights, we have only whole-hearted admiration, for they faced a terrible fate unflinchingly, but this does not obscure to us the fact that their action was necessitated by the helplessness of the State, that is, the organized community in which these things were done. At various periods one side or the other controlled the machinery of the law, from the sheriff to the adjutant general; the whole miserable fight had the appearance of a party quarrel because the public generally did not take sufficient interest in the assertion of the rights of the community. The effectiveness of legal prosecution was weakened by the lack of public support.

Out of all this nightmare of riot and crime, in contrast to the frothy talk of Governor Waite in Colorado, in contrast to the feebleness of Governor Peabody, in striking contrast to the weak executives that had permitted the atrocities in the Cœur d'Alene from 1892 to 1899, stands Frank Steunenberg, who did his duty simply, knowing that it meant his political death, and suspecting that it might end in his physical destruction. He had a calm and courageous resolve to see order restored. "I propose to bring Idaho back into the United States," he said. Steunenberg seems to have been the one man to embody the insistent right of the community to an obedience of law, by the mine-owner as by the mine-worker, by the rich and the poor, by the employer and the employed. He was a martyr to the cause of popular government in America.

Engineers and Ideals.

ON another page we publish an address delivered by Mr. Frank E. Shepard before the graduating class at the State School of Mines of Colorado. Mr. Shepard is himself a graduate from a splendid technical institute and has had an experience of professional life broad enough to fit him as a mentor to young men. He gave them many good hints, much sound advice, and struck some of those nobler chords to which imaginative youth will vibrate. Most of us who have run several laps in a race that grows more exacting as civilization becomes more complex, will appreciate the suggestion that it is not what you study at school or college that counts, but how you do it. Among our successful contemporaries are men of the most diverse training, those who from doctors became cyanide experts and copper metallurgists, some that were lawyers first and mine managers afterward, others that were electrical or mechanical engineers before they developed special skill as geologists or smeltermen. In youth they had learned how to learn, logically and systematically, and their work in life has been logical and systematic. The amount of knowledge that any man carries under his hat is small; his aim is to apply well the little he possesses, and to know where he can obtain the information beyond his immediate ken. Mr. Shepard gave his hearers some ideals of professional integrity. They are needed. If a man has no high purpose in youth, he is not likely to get it later. Life rubs the edges off the crystalline character and tends to make men morally amorphous. It is a brutal fact that if dabbling in stocks on the strength of information obtained professionally is warrant for depriving an engineer of his degree, then a majority of the financially successful men would have to go without that luminous tail. If commissions are unprofessional, the profession will be thinned forthwith, for in large sales of mines it is rarely that the engineer does not get a commission, a bonus, or a participation in stock. Is it wrong? Assuredly. We agree with Mr. Shepard that it dishonors the profession. Young men nowadays are told to become partners with the capitalist, to get financial sense, to be commercially alert, to have an eye not only to business but to 'peeziness'—the Hebrew pseudomorph of ordinary sagacity. Is the profession to be swamped by the broker, promoter, and financier? Is the big salary or the fat fee to be the single aim of the young graduate of today? Or is there to be a *noblesse oblige* among professional men, an ideal of conduct, a sincerity of purpose? We phrase these suggestions in the form of queries, for it may weary some of our readers if we state them as fierce assertions. Assuredly we believe that the engineer should have ideals higher than those of a hod-carrier, a ward politician, or a bucket-shop broker. The pursuit of the shekel is not the only sport in life and the accumulation of wealth is not wholly satisfying. Many there be that say these things and a few that actually believe them. The young men at Golden will have gained from Mr. Shepard's appeal for a higher standard, and we commend it to the older men also.

Personal.

THOMAS J. BARBOUR is at Paris.

J. F. O'GORMAN is at Guadalajara.

ALBERT BURCH is a witness at Boise.

J. MORGAN CLEMENTS was recently at Butte.

JEROME B. LANDFIELD has gone to eastern Siberia.

BENJAMIN MAGNUS is at Sydney, New South Wales.

GEORGE W. BRYANT has opened an office in Mexico City.

ERNST DENICKE has taken charge of a mine at Johnnie, Nevada.

ROBERT H. CHAPMAN was married at Auburn, New York, on June 1.

C. C. BURGER is consulting engineer to the United States Co. of Cobalt, Ontario.

CHARLES BUTTERS arrived at New York on May 12, on his way to San Francisco.

EUGENE SHEFFIELD has returned to San Francisco from the Cœur d'Alene, Idaho.

E. P. MATHEWSON visited San Francisco on his return from Arizona to Anaconda.

C. A. BOHN is ore buyer for the American Smelting & Refining Co. at Chihuahua.

CYRUS W. MCARTHUR, of Denver, was in San Francisco this week on his way to Montana.

P. H. LUND, of Denver, inventor of the Lund drill-sharpener, is in San Francisco, on his way home.

A. P. ROGERS has returned from South America and is now engaged in professional work in Arizona.

W. H. JEFFREY has left Greenwood, B. C., to become manager of the La Rose mine at Cobalt, Ontario.

G. H. KEELER, formerly at Atlanta, Georgia, is manager for the Las Coloradas Co. at Allende, in Chihuahua.

FRANK J. BOOTH met with an accident in the cyanide mill of the Dolores mine, Mexico, and is recovering from it at Berkeley.

WALTER G. PERKINS has resigned as smelter superintendent for the Nevada Con. Copper Company, and is taking a short holiday.

W. C. THOMAS has been appointed general manager for the Dominion Copper Co. at Phœnix, B. C., in succession to T. R. Drummond.

CHARLES WRIGHT, of Los Angeles, was in San Francisco this week on his way to Goldfield, Nev., where he will inspect several mines.

FREDERICK H. SEXTON has been appointed Director of Technical Education in Nova Scotia and Principal of the Technical College at Halifax.

W. W. ALLEN, having completed his year of service with the Caucasus Copper Co., Ltd., in Russian Caucasia, is returning to the United States.

JOHN A. BALCH, formerly smelter superintendent for the Mountain Copper Co., at Martinez, Cal., has accepted the position of manager for the Wireless Telegraph Co., of Honolulu.

F. S. SHERWELL, recently chief engineer of construction to the Real del Monte Co., Pachuca, has formed a partnership with CHESTER A. FULTON, with offices at Guanajuato, Mexico.

WILSON W. HUGHES has resigned as mine manager for the Guanajuato Reduction & Mines Co. to become general manager for the Ellamar Mining Co. in Alaska. He is now at Philadelphia.

Obituary.

CHARLES E. HOFFMAN died at the house of his son at San Luis Potosi, Mexico, on May 20. He was one of the pioneers in California, coming here in 1850. As a professional man he did a large amount of useful work in several Western States.

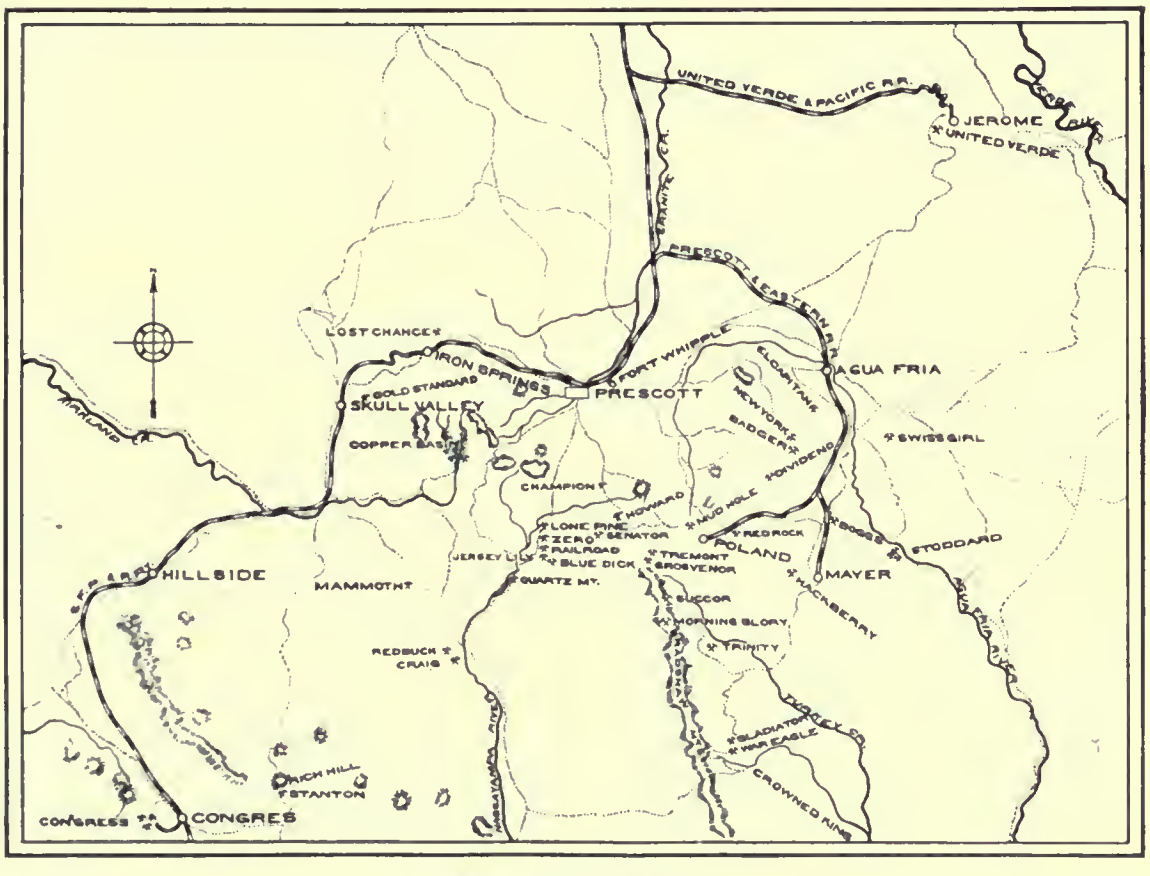
General Mining News.

ALASKA.

KETCHICAN.

H. W. Turner has taken a force of men to the Skowl Arm property of the Omar Mining Co., on Prince of Wales island. This company was mismanaged under the former chief, and a tramway and wharf were built before a mine was developed. There are reported large bodies of sulphide ores, running high in sulphur, and shipments of this class of material will be started at once, as there is 1,000 tons of ore on the wharf.—— The compressor has been installed at the Crackerjack property, and the Puyallup water-power will be used to operate it.—— Work at the Rush & Brown is progressing well, and ore is ready for shipment to the Tyee smelter.—— Work will be resumed at the Moonshine property under the direction of B. C. Bacon. The mine will be opened by a tunnel.——One of the lenses of ore revealed by the diamond drill at the Mamie mine has been opened by a cross-cut tunnel. It is expected that a monthly production of about 3,000 tons will be attained.



Map of a Part of Arizona.

ARIZONA.

COCHISE COUNTY.

The Board of Trade at Bisbee has been for some time trying to get freight rates reduced on El Paso & Southwestern railroad. Every merchant and citizen suffers from the exorbitant rates. It is claimed that the E. P. & S. company charges $1.82 per hundred for a haul of 248 miles, while Eastern roads get $1.74 for a haul of 2,167 miles. The matter will probably be brought to the attention of the Interstate Commerce Commission.——The production of the smelters of the Warren district for May were: Copper Queen smelter, 9,500,000 lb.; C. & A. and S. & P., 4,000,000 lb.; and Shattuck & Arizona, 650,000 lb. of copper.——A new hoisting engine is being installed at the Czar shaft of the Copper Queen.——The sampling works of the Copper Queen smelter, at Douglas, are being enlarged to accomodate the increasing business of the plant. The last of the material for the 125-ft. extension on the east end of the smelter has arrived.

The work of excavating for the new power-house for the Copper Queen company, between the Gardiner and Sacramento shafts, is well under way. When completed, this plant will supply electrical power and compressed air for all the Copper Queen mines, with the exception of the Gardiner and Sacramento shafts, which will use steam throughout. The prospecting drift from the Cuprite shaft in the direction of the Shattuck mine, has connected with the drift from that property. This makes the ventilation better, and it is now possible to go down in the Czar shaft and travel underground to the Shattuck. The work of re-timbering the Czar shaft from the 200-ft. level to the surface is nearly completed.—— The contracts for the erection of the smelter of the Shattuck-Arizona company will probably be signed this month. In the mine, the drift on the 900-ft. level has encountered ore. On the 700 and 800 levels, ore is being developed that is furnishing the shipments to the smelters. An average daily shipment of about 300 tons is maintained. A new Corliss 30-drill compressor is being installed, and will be in operation in July.—— At the Denn-Arizona, the drift on the 1,100 level has encountered several bunches of ore. The shaft will be sunk to the 1,200-ft. level, the railroad spur to the Denn will soon be finished and the company will install three 50,000-gal. fuel-oil tanks. ——The shaft on the Warren property is 230 ft. deep and 15 men are employed. The shaft will be continued for several hundred feet before any driving is done.——The shaft on the Cochise Development Co.'s property is 930 ft. deep and drifts are being run on the 600 and 900-ft. levels.——At the Domoerata, a winze is being sunk in ore, that will go to the 600-ft. level. This mine now has the greatest actual depth below the surface in continuous workings, of any property in the district.——Shipments during the past two weeks from the Cole shaft of the Superior & Pittsburg were the greatest since it has been in operation. At the Hoatson shaft, sinking is progressing rapidly. Operations will soon be commenced at the Briggs shaft.——The Calumet & Arizona company has paid $2,000,000 in dividends for the five months in the current year, making a total of $8,00,0000.

MARICOPA COUNTY.

The Unida Gold M. Co., 14 miles east of Wickenburg, is working steadily. A 25-h.p. hoist is in operation, and teams

have been hauling ore to the railroad and a shipment will soon be made to the smelter. The main shaft will be sunk 500 ft. without delay. George Margreti is the superindent.

GILA COUNTY.

(Special Correspondence).—Plans for the enlargement of the Old Dominion Co.'s surface works at Globe are engaging the attention of the local management. The structural steel for the extension of the smelter building, delayed by the congestion of freight on the Rock Island railroad, has been traced and its delivery is promised at an early date. Construction will then proceed rapidly and No. 5 furnace should be in operation by July 1. The plans include the installation of another furnace, the construction of an additional dust chamber and the erection of another stack 200 ft. high, and having double the capacity of the present stack. These and other enlargements will require the remainder of the year for their completion. Of importance in this connection is the enlargement of the smelter ore-bins, to be undertaken at once. The capacity of the bins, now 3,600 tons, is to be increased to 4,800 tons by an extension 72 ft. long. Sixteen new automatic charging scales will be added, so as to load six charging cars at one time instead of three cars, as at present. The smelter has been running at full capacity, with four furnaces in blast since May 1, and the output of copper has averaged better than 50 tons per day, which means a production for the month of 3,000,000 lb., barring any interruption of smelting. Receipts of coke have increased and a reserve is being slowly accumulated. The company has an enormous amount of supplies in transit, shipments aggregating 2,000 cars, of which 1,800 cars are coke.——The Continental mine is contributing high-grade sulphides, and the United Verde, Gibson, and Arizona Commercial mines are making regular shipments, mostly sulphides. Custom ores are still being purchased and what is not sold to outside smelters is stored. The supply of ore promises to exceed the capacity of the smelter, even after the two new furnaces have been installed.——Operations are now on a larger scale at the Copper Hill mine, and ore shipments have been increased to 200 tons per day. Of this amount 130 tons is sulphide ore, which goes to the Old Dominion smelter, and 70 tons of silicious ore is shipped to the Douglas smelters. Only three cars of ore have been shipped from the Blackhawk mine thus far. The sulphide orebodies in the Copper Hill look well and development work is being carried on. Two new boilers for the mine have been shipped from the East. At the Blackhawk sinking is progressing rather slowly at the depth of about 550 ft. The pumps are raising about 275,000 gal. of water per day. A Prescott pump of 500,000-gal. capacity has been ordered. The Arizona Commercial railroad is hauling all this company's ores, as well as sulphides for the Globe Consolidated, the Iron Cap, and Superior & Boston, taxing its present capacity. Another and larger engine has been ordered.——During the past week a small vein carrying hematite was encountered in the north cross-cut of the Gem shaft of the Globe Consolidated, and for a time it was thought that a strike had been made. On account of the flattening of the vein from 80° on the 500-ft. level, it was at first supposed that the vein was wider than it is. Work in both cross-cuts on the 500-ft. level has been hampered during the past week by the flow of water, which necessitated the use of buckets for hoisting water much of the time. However, the water is not increasing, and after some timbering is done, work will be pushed. Pumps and pipes are on the ground and will be installed at once to handle the water. The formation in the south cross-cut shows signs of mineralization, while the north cross-cut is in porphyry, with some traces of iron. Sinking in the shaft is still progressing, with no change in the formation.

Phœnix, June 8.

MOHAVE COUNTY.

Work is progressing on the Frost-Mehaffy properties, at Wallapai Springs, and some good ore has been opened. The Tawa Development Co. has a shaft down 200 ft., which has opened a seven-foot vein carrying an 18-in. streak of shipping ore.——The Benedictine M. & M. Co., operating at Cedar, may build a 28-mile electric road from Yucca to the mine and mill. The company owns 40 claims, and is operating the Arnold properties. The mill has a capacity of 150 tons per day, and is to be increased to 1,000 tons. Amalgamation, cyanidation, and concentration are used in treating the ore. The company is capitalized for $20,000,000, and also owns properties near Prescott, and in Yuma county, near Kofa.——The Cerbat Mtn. Mining Co. shipped a car of concentrate and a car of first-class ore to the smelter last week. The mill is running steadily on ore from the Vanderbilt mine.——The Gem mill has been running steadily on ore from the Golden Star Co's properties, and two carloads per week of concentrate are shipped.

YAVAPAI COUNTY.

H. J. Beemer has struck more rich ore in the Storm Cloud, in the Hassayampa district, 12 miles south of Prescott. The strike was made in a drift at a depth of 250 ft. About 35 tons of ore per day is shipped from this property, by way of the Poland tunnel, to the smelter at Humboldt.

YUMA COUNTY.

At the annual meeting of the Victor & Bell Crown Mining Co., at Salome, the following officers were elected: John B. Martin, president and manager; J. H. Matteson, secretary and treasurer; and F. C. Piper, T. H. Finnegan, W. E. Enos, and R. R. McDonald, directors. The seven claims of the company are in the Harcuvar Mtn., eight miles north of Salome. Several shafts have been sunk, and a contract has been let to sink to the 250-ft. level on the Belle Crown.

CALIFORNIA.

AMADOR COUNTY.

The pipe-line, for carrying fuel oil from Martell to the Kennedy mine, has been completed. This ought to eliminate any future trouble for the Kennedy, as far as fuel is concerned.

CALAVERAS COUNTY.

The Moosehead placer property, 12 miles from San Andreas, has been purchased by New York people. This mine adjoins the famous Sheep Ranch quartz mine. The organization will be known as the Moosehead Water, Power & Mines Co., and will be financed by William V. Holley, a New York broker. Several hundred prospecting pits have been sunk. Two giants are now in operation, and a five-stamp mill is on the ground.

NEVADA COUNTY.

The Banner mine, on Banner hill, will be pumped out at once. Operations were discontinued on this property last winter, on account of the lack of fuel.—— The outlook at the Fairview mine is promising. The main tunnel is in 400 ft., and will be driven 600 ft. farther. A winze is being sunk from the 300-ft. level of the Murchie Extension. C. M. Wilson is the manager.——Good ore has been struck in the Canada Hill Consolidated mine, commonly called the Charannat. The vein is strong and the ore a free-milling quartz.——The Kendalls of Alameda are trying to buy the Republic mine, at Graniteville.—— It is rumored that the Campbell Blue Point gravel mine has been bonded.——The Ethel mine, near Gaston, has just been examined by engineers.——The annual meeting of the directors of the Alleghany Mining Co. will be held in San Jose June 17. The property of the company suffered serious damage during the winter, owing to snowslides and floods. W. W. Tiner is superintendent.

EL DORADO COUNTY.

The Pilot Hill mine is bonded to Alameda people, and the Coster mine at Cooper's ravine has been bonded to a Colorado company.——Work has been resumed on the Noonday copper mine, below El Dorado, and the shaft will be sunk 200 ft. deeper. The owner is the Peyton Chemical Co., which uses the ore largely in the manufacture of sulphuric acid.——The shaft on the Pacific Union mine, superintended by John E. Sexton, has reached gravel.

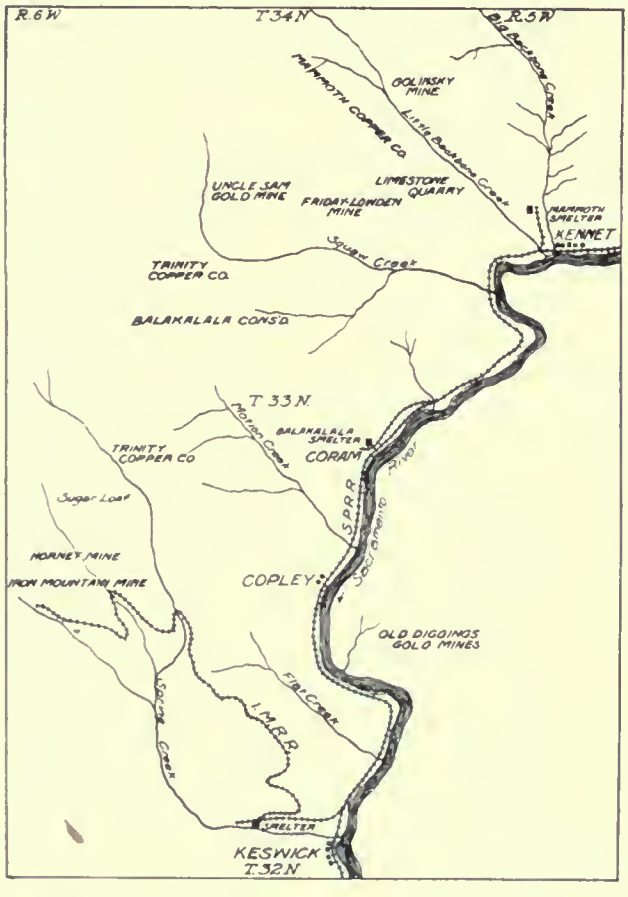
PLACER COUNTY.

The new pump for the Crater mine has arrived and will soon be working. The shaft is 800 ft. deep, and it will take five weeks to unwater it.——A tunnel is being run on the

Three Queens property, from Volcano cañon, parallel with the lode. Shafts will be sunk on the outcrop.——The Evening Star property is being examined and may be operated again.

SHASTA COUNTY.

Systematic diamond-drilling is in progress on the Stowell property, by interests identified with the Balaklala company.——A small force of men is developing the Copper King property on Motion creek, which is a part of the Trinity Copper Co.'s holdings. Morgan Thomas is directing the work.——The Mountain Copper Co. will employ 30 men on the fractional claim near the Weil tunnel of the Balaklala company. A double-compartment shaft will be sunk.——About 25 men, under Eugene Bergath, are employed at the Sugar Loaf mines, west of Coram.——The Vulcan group, between the Balaklala and the Shasta King,



Map of the Copper Region in Shasta County, California.

has been incorporated under the name of the Great Verde.——In the Lower Springs district, west of Redding, the Stauffer Chemical Co. is developing a good orebody in the Conner property, which it has under bond.

TUOLUMNE COUNTY.

Grading is finished for the new mill at the Ellen Winton, and the mill is being erected.——R. B. McGinnis has completed an examination of the Wide West claim.——A force of men is being secured for the Kanaka property.——The new compressor for the Big Casino mine has arrived.

COLORADO.

CLEAR CREEK COUNTY.

(Special Correspondence).—Edward Butts & Co., working a large block of ground under lease in the Aston mine, on Democrat Mtn., have a streak four inches wide of ore which assays 4,000 oz. silver per ton; alongside of this streak there is two feet of ore which assays 394 oz. silver per ton. No work has been done in the Aston mine for the last six years. The mine is owned by the Red Oak Mining Co., for which A. B. Montgomery is the general manager.——The Capitol Mining Co. has commenced grading for its new power building. A 100-h.p. boiler and 20-drill air-compressor will be installed. The company's main adit is now in 4,400 ft.; several fine lodes have been intersected, one at 4,000 ft., showing three feet of ore which mills $30 per ton. Laterals will be driven on several of the lodes and a concentrating mill will probably be erected.——B. L. O'Connell, leasing on the Frostberg lode of the Mendota mine at Silver Plume, has uncovered a foot of lead ore which mills $70 per ton. The lease is being worked through the Victoria tunnel, a winze having been sunk 125 ft., from the bottom of which a drift was run 200 ft., and stoping commenced.——The Ramsdell Gold M. & M. Co., operating on Lincoln Mtn., has commenced grading for a 75-ton concentrating mill. Geo. W. Teagarden is general manager. A body of good concentrating material is now opened up in the mine.——Ore which gives returns at the mill of $60 per ton in gold and silver, with 40% lead, has been discovered in the Captain Billy Neach property on Young Mtn. in the Atlantic mining district; the property is owned by the Vigilant Mining Co.——Work has been resumed on the North Star mine in East Argentine. Drifts will be run on a streak of high-grade silver-lead ore. A number of the Rock Island railroad officials are financing the enterprise. Mr. Bonham is the local manager.——Jim Jones & Co. have been awarded the contract for putting through the raise from the Scepter mine to the Sunburst adit on Democrat Mtn.; there is still 165 ft. of ground to be broken before the connection is made. The mines belong to the Red Oak Mining Co. When the connection is made all the company's ores will come out through the Scepter adit on the Georgetown side of the mountain, saving much expense in hauling ——The mines at Empire are again coming to the fore. Ten sets of lessees are at work in ore on the Golddirt mine, owned by the Empire Tunnel Co., of which Clarence Jarbeau, of Georgetown, is the manager, C. C. Wilder, leasing on the fifth level, is shipping 40 tons of smelting and 105 tons of concentrating ore weekly. Benzel and Brancase ship 25 tons of ore weekly, which averages six ounces gold per ton. The Mint mine, belonging to the Benzie Investment Co. of Denver, is making shipments of ore.——From the present outlook, much greater activity in this district is expected than has been the case for many years.

Georgetown, June 9.

SUMMIT COUNTY.

(Special Correspondence).—That portion of Summit county comprising Montezuma and Argentine districts shows considerable activity in a mining way. It is reported that the Colorado & Southern railroad will extend its tracks from Keystone, the present terminus, to the forks of the creek about one mile below the town of Montezuma. A project is now on foot to build a surface tramway, similar to the one in operation in Gilpin county, from the forks of the creek to the horseshoe above Rathbone or Argentine, to connect with the Vidler tunnel which is being pushed through the mountain from the Georgetown side and which it is estimated will be completed in about seven months. Should this work be accomplished it will be the means of opening up a large territory heretofore practically worthless on account of the long distance to the railroad.——It is understood that Mr. Leebrick of Idaho Springs has secured control of the old Bullion mill at Montezuma and is putting it in shape to handle lead and zinc ores from this district. The mill will be operated by electric power.——Word has been given out that the Pennsylvania mill under the management of W. B. Lewald is to be increased in capacity from 200 to 300 tons per day. Machinery has already been shipped for the Lenawee mill which will be increased to 200 tons per day.——Machinery is being installed by the Argentine Electric Light & Power Co., to generate 1,000 h.p. for use in the two districts.——The sale of the ditch and water-rights of the Oro Grande Placer Co., of Dillon, is reported as having been made to W. B. Lewald of Montezuma and W. H. Foster of Dillon, who will erect a large electric plant near Dillon for power purposes.

Montezuma, June 7.

IDAHO.

SHOSHONE COUNTY.

(Special Correspondence).—Charles H. Reeves, of Spokane, one of the owners of the Hercules mine, has bought

250,000 shares of the Sunrise Mining Co., which owns a group of 11 claims in the Cœur d'Alene. The property is a mile west and a quarter of a mile north of the Hercules mine. The capital stock was recently increased from $1,000,000 to $1,500,000, the new issue of 500,000 shares being put into the treasury. C. H. Reeves has been elected president; O. C. Smith, vice-president; and Bruce Worstell, secretary and treasurer. J. N. Rice and George Blue are the other members of the board of directors. The lower tunnel, No. 3, has tapped the orebody. No. 3 tunnel is in 935 ft., and has attained a depth of 360 ft. below the showing in No. 2 tunnel, and a total depth of approximately 500 ft. The vein had been cross-cut 25 ft. before the orebody was broken into. The same shot which opened up the ore started a big run and a heavy flow of water, so that as yet the extent of the deposit has not been ascertained. In No. 2 tunnel the orebody was followed for 200 ft.——At a recent meetlng of the newly elected directors of the Tamarack & Chesapeake Mlning Co. in Spokane, it was decided to build a 100-ton concentrator, a mile-long tramway, and to install a 30-drill compressor as soon as possible. The work will cost $100,000. There are $30,000 in the treasury, and 220,000 shares of stock unissued. The mine is up a branch of Nine Mile creek, six miles from Wallace. Ore worth $25,000 is awaiting shipment to the smelters. The company expended $35,000 in development and improvements the last year. The tunnel has been driven 1,500 ft., and the mine is said to be in excellent condition. The officers and directors are: President, treasurer, and manager, Harry L. Day, Wallace; secretary, F. M. Rothrock, Spokane. The board of directors is composed of the officers, and Eugene R. Day, Jerome Day, E. H. Knight, J. H. Wourms, Dan. P. Bagnell, Edward Boyce, and C. Fred Kratzer.—— Three rich ore strikes are reported in the Golden Chest mine at Murray. The find was made on the lower 2,600-ft. cross-cut tunnel and two veins were opened. The first vein is five feet wide, and the vein beyond, two feet. The first is on the contact between quartzite and slate. The strike was made 1,000 ft. below the outcrop, and is a direct contradiction of the statements made that the mines of the north side lose by depth. The mill at the mine has been closed three years, during which time the development work has been extensive. Two shifts of 40 men, with three machines, are blocking out ore.——Improvements in mine and mill are being made at the Snowstorm, near Mullan. Several sidetracks are being put in by the Northern Pacific railroad, and a station is to be established at Larson, so that shipments can be made direct from the property. A 300-h.p. air-compressor is being installed, and will be operated by water-power to supply air to the various levels of the property. A 20-drill compressor has also been ordered, to be installed in the building with the 18-drill compressor now supplying air for operations. The mill is being enlarged, and three leaching tanks of large capacity will be added. Ore between two and three per cent is being treated at the mill, while the greater mass of ore now being taken from the east drift on No. 3 level, running above eight per cent copper, is shipped direct to the smelter. Bunk and boarding houses are being erected at the mouth of No. 3 tunnel and at the mill. These will accommodate 300 men. The cost of the improvements has been estimated at $500,000.

Spokane, June 10.

NEVADA.

CHURCHILL COUNTY.

(Special Correspondence).—Twenty cars of ore, averaging $250 per car, were shipped from the mines here during May. Machinery is rapidly arriving. It is reported that a branch road will be built to this camp by the S. P. Co. ——Ore running $200 per ton has been uncovered in tunnel No. 3 at the Nevada Hills. A five-foot vein of quartz has been found in tunnel No. 5, and ore has been discovered in the cross-cut in the 100 level of the shaft. The non-arrival of the hoist has compelled the suspension of shaft-sinking. ——The head-frame is in place at the Dromedary Hump, but operations are greatly hindered by the non-arrival of the hoist. Such work as is being done shows some ore.—— A new hoist has arrived for the Golden Boulder and is being installed. Sinking will be carried on from the tunnel.——The main tunnel at the Ida is in 300 ft. and is being extended 18 ft. per week. No. 2 shaft is down 90 ft., with cross-cuts running northeast and southwest. Shaft No. 3 is down 45 ft. All the shafts and tunnels are in ore, and a large force of men is employed.——At the Wyoming-Fairview, the shaft is down 40 ft.——An 18-h.p. hoist has been ordered by the company.——Development is steadily progressing at the Fairview Red Rock, and several men were recently added to the force.

Fairview, June 12.

ESMERALDA COUNTY.

(Special Correspondence).—During the week ending May 25, 1,532 tons of ore was shipped from the Goldfield mines. The output was from the following properties: Mohawk, 230 tons; Francls dump, 220; Loftus, Davis & Sweeney lease, 183: Morton-Beesley lease, 145; Combination, 138; McNaughton lease, 87; Oddie lease, 240; Truett lease, 67; Jumbo, 33; Quartzite, 75; and Mohawk-Jumbo, 5 tons of ore.——A six-foot vein has been found in the 275-ft. level on the Red King claim of the Little Florence. Samples of the ore run well.——The Elk Con. M. & L. Co. has been granted a three-year lease, at a royalty of 25%, on the Jackass group. Under the terms of the lease, a three-compartment shaft will be sunk to a depth of 500 ft. by Jan. 1, 1908. The company is composed of Colorado men. ——The Mohawk-Florence vein has been penetrated, and a body of low-grade ore found on the other side.——The shaft at the Baby Florence is down 60 ft., and a 25-ft. cross-cut is being driven from this point. The new hoist has been installed.——Cross-cutting is under way on the 235-ft. level of the Atlanta, and some good ore has been found.——A 30-h.p. gasoline hoist has been installed on the Lucky Scotchman, and the shaft is down 80 ft.——The shaft of the Jumbo Wonder M. Co. is down 125 ft. and is being sunk. The mine is well equipped.——Ten carloads of ore is ready for shipment at the St. Ives and development is rapidly progressing. The shaft of the lessees is being rapidly sunk, and a cross-cut will be driven to connect with the cross-cut from the main St. Ives shaft. A compressor will soon be installed.——The Goldfield Monarch Co. is sinking a 400-ft. shaft on its holdings. A small vein was encountered at a depth of 35 ft. A 20-h.p. hoist has been installed, and two shifts are employed.——The shaft at the Third Chance has attained a depth of 115 ft., and at the 110-ft. level a small vein running $30 per ton was found.——Walter C. Stone, M. J. Monnette, Hugh Trenholm, J. T. Andrus, and W. C. Wylie have purchased a group of claims at Phillipsburg, northwest of this city, and are organizing a company to develop the property.

Goldfield, June 2.

HUMBOLDT COUNTY.

(Special Correspondence).—At the Brown Palace, two tunnels are being driven, a double-compartment shaft being sunk, and surface prospecting under way. Some ore has been encountered.——The Rabbit Foot group has passed into the hands of the Schwab interests. The purchase price is said to be $90,000.——On the Florence group a 12-ft. vein has been struck.——A three-compartment shaft has been started on the west end of the Dreamland, and will be sunk to a depth of 300 ft. From this point drifts will be run. Ore has been found at a point 80 ft. east of the 60-ft. prospect shaft.——A strike has been made in the Big Six, selected samples of the ore running well. The surface outcropping is 60 ft. wide. The mine is owned by the Schwab interests.——Development at the White Alps is steadily progressing, some excellent ore having been extracted. Salt Lake people own this property.——A lode carrying gold has been struck in the Golden Anchor.——The Powhattan and Rattler mines are showing up well.

Rosebud, June 6.

NYE COUNTY.

(Special Correspondence).—A 120-h.p. steam-hoist has been installed at the three-compartment shaft at the Montgomery-Shoshone mine, and the new reduction works are being erected with the utmost celerity. The main shaft is down 500 ft., and ore is being blocked out. A car of high-

grade ore is shipped daily to the Salt Lake smelter, while 20,000 tons of low-grade ore is stored on the dump. When the plant is completed it will handle about 375 tons of ore per day. Bryce Turner is manager of the mine.—— The main shaft at the Gold Bar is down 425 ft., and the orebody has been proved for 1,100 ft. on the 150-ft. level, and 2,000 ft. on the 300 level. A 20-h.p. hoist is at the mine, and reduction works will soon be installed. A small shipment of ore from the Gold Bar averaged $341 per ton. Good strikes of ore have been made in the 115-ft. level, and in the 175-ft. drift from the 200-ft. level. The ore-shoot in the 200 level runs well. At other points the mine is looking well, and L. P. McGarry, the superintendent, is pleased with the outlook.—— The Combination and Washington properties, comprising 16 claims, and situated in the Lee district, have passed into the hands of the Gold Bullfrog M. Co. The company will build a mill at Gold Springs, 10 miles north of

Map of Southwestern Nevada.

this city, where it owns a water right. A mill is also being built seven miles north of here by the same company, and will soon be in operation.—— The owners of the Tramp Consolidated mine are preparing to erect a mill at an early date. Developments are opening up some low-grade orebodies.——At the Mayflower, development is steadily progressing.——Springdale, the new camp north of this city, is attracting attention from local miners, on account of the strikes made in the Oasis Bullfrog, Aurora Bullfrog, Springdale, and Bullfrog-Mogul properties. The formation and general characteristics of the ore resembles that found in the Mayflower. The camp is on the Goldfield & Tonopah railroad, while the Clark road is a short distance west, with the Borax Smith road building to the camp. Plenty of water is available, and two electric-power companies are in the field to supply the mines and mills.

Rhyolite, June 7.

(Special Correspondence).—The old camp of Reveille is enjoying a revival of mining activities.——The Nevada Smelter & Mines Co. is operating two gasoline hoists on their recently acquired properties. The main shaft is down 300 ft., while another is down 200 ft. The ore carries silver and lead.——A small vein carrying a little gold was recently encountered in the Granny mine. The shaft has reached a depth of 200 ft. and will be sunk to the 300-ft. level. Some silver-lead ore has been tapped in a cross-cut from the 70-ft. station of the main shaft in the Homestake.——A good strike of gold-bearing ore was recently made in the Iron Mtn. claims, five miles north of Reveille. A hoist will be installed at once. J. C. Hadley is the company's local manager.

Reveille, June 9.

WASHINGTON.

SPOKANE COUNTY.

While working in the Spokane Tin Mines Co.'s properties, six miles east of Spokane, miners encountered a vein of tungsten ore 600 ft. from the shaft now being sunk in the tin deposit. A picked sample assayed 33% tungsten concentrate, or about $300 per ton tungstic acid. The shaft in the tin ore is 45 ft. deep in the hanging wall and the showing continues good. D. P. Bagnell & Co., of Spokane, have taken an option on 450,000 shares of treasury stock in the company incorporated for $150,000. Charles Thies, secretary, announces that as soon as the length of the tin vein is determined a shaft will be sunk. Development work on the property bears out the reports of the strike made a short time ago. Ore is being taken out as the work advances, the best assay thus far being $200 per ton. An open-cut is being run to ascertain the length of the ore-shoot, and this cut has now reached 60 ft., 35 ft. of which is in ore. The pay-ore varies from four to six feet in width and is said to average 10% black tin concentrate assaying 70% tin.—— Eighteen inches of clean coal was found by well diggers at Hillyard, near Spokane, at a depth of 180 ft. The vein, dipping at 45°, was encountered between walls of slate. The coal was tested and burned well, but left a clinker. The find was made two weeks ago, but was kept secret till enough work could be done to show the vein. The well has been driven farther and water secured, but the pumps have not been put in, as the company is exploring to learn more about the deposit. The Hillyard Water Co., which made the discovery, owns a half-block of land in the vicinity of the well. The rest of an 80-acre tract is owned by the Spokane Suburban Co., in which Arthur D. Jones is the principal stockholder.

The work of development on the tin mines on Moran prairie, eight miles south of Spokane, where a find was made by Richard Marsh recently, is to go on in earnest. The company has been organized and the work of gaining depth will be continued by hand to a depth of 75 to 100 ft. If the showing continues to that depth, machinery will be installed and extensive work will begin. The Spokane Tin Mines Co. has elected directors and these directors have named Charles Robbins, president; Richard Marsh, vice-president; Charles Thies, secretary and treasurer. The company is incorporated for $1,500,000, with the following directors: Charles I. Robbins, Charles Thies, Richard Marsh, William Huntley, and W. J. C. Wakefield.

OKANOGAN COUNTY.

(Special Correspondence).—A stringer which has been followed by the lower tunnel on the Security, a Palmer Mtn. property near Loomis, has widened to a two-foot vein of well-mineralized white quartz. Several prospecting tunnels have been run in on this property, where the ore outcrops, and gold and silver ore has been exposed.——An assay at the 200-ft. level on the Copper World extension gives $24.60 in copper. This vein is 20 ft. wide where first cut and a drift from this cross-cut has been run to the west a distance of 120 ft. along the foot-wall of the orebody. Another cross-cut made at that point shows the ore to be 30 ft. wide.——A survey for a tram, to be run from the mine to a point on Palmer Mtn., four miles from the V. V. & E. railroad, is soon to be made. It is the intention of the company to construct the tram this summer and ship ore to the smelter at Grand Forks.——Monroe Harmon, general manager of the Ruby mine at Nighthawk camp, northwest of Oroville, says that as soon as the railroad spur is completed to the mine he will begin to ship ore. The mine has been opened by a mile of tunnels, shafts, winzes, drifts, and raises, and in addition to the 500 tons of ore now in the ore-bins, the mine can produce steadily high-grade ruby-silver ore. A concentrator will be built.

Spokane, June 8.

Special Correspondence.

Cobalt, Ontario.

Increased Shipments.—New Discoveries.—Extension of Productive Area.—The Temiskaming Mine.—The Beaver-Cobalt Co.—The Rochester and Cochrane Properties.—The Progress.—Activity at the North End.—Recent Finds of Rich Ore.

Increased shipments, the result of slightly improved condition of roads and warmer weather; some surface finds (those at the Nipissing and Buffalo being particularly rich); and an encouraging development at the south end of Coleman township are the dominant features of Cobalt today.

From January 1 to May 25 the total output was 4,120 tons. The output during 1906 amounted to only 5,129, so that it is apparent that there will be a large increase this year. The Nipissing, O'Brien, Coniagas, Buffalo, Trethewey, and Jacobs are the leading shippers. Among the new mines the Right of Way and the Temiskaming are sending out very rich ore. The last mentioned has received the smelter returns for its first car-load of less than 27 tons. It netted, after paying freight and smelter treatment, $90,000. It is this mine that has created such interest in the southern end of Coleman. Last year it was termed a wild-cat. It has now proved itself. They started to sink on a mere calcite stringer and as depth was attained native silver was found at 45 ft. and at 75 ft. a rich orebody was reached. The main shaft is sunk right on the vein and it is now down 82 ft. and 250 ft. of driving has been done at the 75-ft. level. A winze has been sunk from this drift, at a distance of 113 ft. from the shaft, for 35 ft. and for the last 29 ft. the vein has widened to two feet, a mass of calcite and silver, with some niccolite. Less than 4% cobalt is found in the ore. In this respect it resembles the Silver Queen ore. There is a six-inch calcite vein with a little silver on the property that crosses the main vein. A 40-ft. shaft has been sunk on it and a cross-cut will connect it with the main vein. Both will be worked from the main shaft, which is a well-timbered 5 by 9-ft. double-compartment shaft. There is another 2-ft. calcite vein that carries silver. A shaft is sunk on it to a depth of 30 ft. The wall-rock is not heavily impregnated with silver, as where the veins are narrow and very rich. Nevertheless the screenings from the wall-rock at the Temiskaming are sacked. They carry from 350 to 600 oz. silver per ton. This mine will make a second shipment of 30 tons of rich ore and a ton of second-grade ore this month.

Floyd Harman, the superintendent of the Temiskaming, has mined in Idaho and other Western States and is a firm believer in underground exploration.

Several buildings have been erected, including an 18 by 93-ft. power-house, but the delay in getting machinery is a serious handicap. A 100-h.p. boiler and a six-drill compressor have been ordered and the boiler has arrived, but owing to bad roads it has not yet reached the property. The serious handicap at Cobalt today is the delay in getting machinery.

The 20 acres adjoining the Temiskaming is owned by the Beaver Cobalt Co. This company has erected first-class buildings and a good plant, including a 14 by 22 duplex Rand compressor, an 80-h.p. boiler, a hoist capable of lifting 3,500 lb. 100 ft. per min. Air-drills are in operation and seven veins have been found. The main shaft is down 60 ft. and will be continued to 125 ft., with drifts at the 75 and 125-ft. levels. They have a 14-inch calcite vein containing silver, and a new vein has been discovered on the surface that is five inches wide and is composed of cobalt and calcite. This property should be sacking ore right away. Fifty men are employed at the Temiskaming and 22 at the Beaver. Tom Stephens, superintendent of the Beaver, is a good practical man and will also do a lot of exploration work underground.

At the Rochester mine, which is owned by Cleveland people, a small steam plant is at work, but they, too, are being kept back owing to delay in getting their machinery. The concrete masonry for the compressor is laid but the machinery will not be delivered for a month yet. The main shaft has been sunk to a depth of 90 feet since the end of February. Two good veins have been found but only one is being worked. The main vein had a surface capping of cobalt bloom and galena and is 8 in. wide. Native silver was found two feet below bedrock and the assays from surface down have shown from 916 to 1,500 oz. silver per ton. Eighteen sacks of high-grade ore were taken out of the shaft while sinking the first 60 ft. At that depth the vein dipped; at the 75-ft. level it was necessary to cross-cut 10 ft. to find it. This would be a shipping mine today had they been able to get in their plant. The company has 60 acres in Coleman and is capitalized at $1,000,000.

At the Cochrane a rich vein four feet wide has been uncovered for a couple of hundred feet and a test-pit sunk to a depth of 10 ft. Near the boundary between this property and the Temiskaming a two-foot vein has been found and there are four good veins on this property. A 40-h.p. steam-plant is at work and they have started their main shaft. Good buildings are erected, and, like all other properties in this part of the camp, they are burning the underbrush and making good-sized clearings, as a protection from summer fires. Edward Doherty, the superintendent, came here from the Shakespeare mine, near Webbwood, in New Ontario. He has 20 men at work. J. Wilbur Kay is the managing director and the property is controlled by prominent Cobalt and Detroit men. No stock has been put on the market.

The Crown Prince is now operated by the Duchess Silver Mining Co. George E. Foster, formerly Minister of Finance for the Dominion of Canada, is president. The claim was staked by Earl Prince of Chicago last July and passed inspection in September. He uncovered seven veins and under the present management as many more have been found, four of which are being worked. The main vein from the Cochrane extends to this property, and Sydney L. Smith, the superintendent, intends to explore it vigorously. The Progress mine adjoins. Here Bert Grover, another Western man, has a small plant installed and is doing some underground development on the main vein, which is a strong calcite seam. The shaft is now down 80 ft. and a drift is being run at the 65-ft. level; 17 men are at work here and good buildings have been erected.

Fred. E. Calverley is another man who did a lot of work last summer in this part of the camp. At the Wettlauffer-Calverley property, which consists of 50 acres and adjoins the Progress and Duchess, a fine showing has been made. Adjoining them is the Shutts, where a rich vein has been found running the length of the 20-acre lot and traced to the Hyland 10 acres on the north and from there to the Calverley 10 acres. On the Calumet a rich find has been made in a shaft at a depth of 50 ft. These properties extend south of the Jacobs and Drummond mines, which were long considered to be the southern limit of the rich area and it is only this winter and spring that this extension has been proved to be good. Starting with the Badger and ending with the Calumet is a string of fine prospects and budding mines. One, the Temiskaming, has proved by its shipments that it has as rich ore as anything in the camp.

Activity prevails even further south in the township of

Lorraine and in the unsurveyed territory to the south of that township, where in the diabase and Lower Huronian formation some good finds have been made recently.

At the northern end of the camp and in the township of Bucke a lot of surface prospecting is being done. The United States Co. holdings lie right in the range of shipping mines. The Trethewey and Temiskaming & Hudson Bay finds have made it one of the most promising of the new enterprises. Frederick G. Corning (of the Guanajuato Consolidated Mining & Milling Co. and the British Guiana Gold Concessions Co.) is the president; C. C. Burger, of New York, is the consulting engineer and Stafford Higgings of Toronto is the managing director. They have 120 acres in Bucke, just across the border between that township and Coleman. Eighty acres of their property adjoins the O'Brien syndicate and the La Rose holdings and the third 40 acres adjoins the Temiskaming & Hudson Bay, where a bonanza vein was recently uncovered. Two very strong seams have been found—on one 40 acres and only last week a promising find was made on the lot adjoining the Nancy Helen. It consists of decomposed calcite rich in silver. The managing director came up from Toronto and as a result of his visit, Superindent Sargesson has started a new shaft on the vein.

Salt Lake, Utah.

Production of Zinc.—A Smelter for Zinc Ores.—Shipments From Tintic.—News From Bingham.—New Consolidations.— Park City Mines. Dividends.

The producers of zinc in Utah and Nevada have long been in the need of facilities for the treatment of their ore. Heretofore, ore of this class has been shipped to the reduction works of Colorado and Kansas and, although this procedure has been profitable to the owners of zinc mines, excessive freight rates has made it prohibitive to the movement of the lower-grade ore. In view of the constant increase in tonnage, the need of a zinc smelter nearer home has become more and more apparent and for several months the matter of building a plant of this kind somewhere near Salt Lake has received serious consideration. The announcement was made several days ago to the effect that Samuel Newhouse had become interested in the project and that the well known Salt Lake mining man had practically assured the zinc producers that a smelter would be built. Mr. Newhouse has become interested in Pioche and Good Springs, Nevada, in mines productive of zinc and no doubt that has been one of the reasons which induced him to make up his mind to invest in the enterprise. Zinc has become an important factor in Utah's mineral output during the past two years. The Daly-Judge, Daly-West, and other mines at Park City are producing zinc ore; so are the Horn Silver and Talisman mines in Beaver county, while the Scranton, in the North Tintic district, is recognized as being one of the leading producers of zinc in the West.

The ore shipments from the Tintic district last week amounted to 169 carloads, the contributing mines and respective amounts being: Ajax, 4; Bullion Beck, 8; Beck Tunnel, 12; Centennial Eureka, 52; Colorado, 11; DePue, 6; Eagle & Blue Bell, 1; Eureka Hill, 1; Grand Central, 6; Godiva, 2; Lower Mammoth, 5; La Clede, 1; May Day, 4; Ridge & Valley, 8; Scranton, 6; Tintic Iron, 11; Uncle Sam, 6; Yankee Con., 8; other mines, 2 carloads. The name of the Crown Point Mining Co., operating in the Tintic mining district has been changed to East Tintic Mining Company.

The Utah Apex mine in Bingham is doing well and prospects are excellent. The usual shipments of high-grade ore, about 100 tons per day, are being made, while 200 tons of low-grade ore are being mined for treatment in the Markham Gulch mill. With the showing that the mine has in low-grade ore, the mill could be kept going at double its present capacity indefinitely.——The North Bingham Consolidated Mining Co. has been organized at Provo to operate a group of six mining claims at Bingham. Jesse Knight of Provo is at the head of this enterprise.

The directors of the Utah mine, in the Fish Springs district of Juab county, have given an option on a control of the stock on the basis of $2.50, which means $250,000 of the entire mine. The Utah is a dividend-payer, the usual monthly distribution on the basis of three cents per share.——Amended articles of incorporation of the May Day Mining & Milling Co., have been prepared in accordance with the late deal, by which the May Day company acquired the Uncle Sam, Inez, and Humbug No. 2 fractional mining claims from the Uncle Sam Consolidated Co., for a consideration of 400,000 shares of stock, which was obtained by increasing the capital stock from 400,000 to 800,000 shares. The mill formerly operated by the Uncle Sam Co., has become the property of, and will be operated by, the May Day Company.

The management of the South Columbus Consolidated mine at Alta has announced that regular shipments will begin at once and that it is the intention to market 500 tons within the next 60 days.——Some extensive bodies of low-grade mill-ore have been developed in the Albion mine at Alta, as well as some stuff of shipping grade. This company will probably install milling facilities during the present year.——Ore shipments from the Park City district last month amounted to 8,556 tons of ore, the contributing mines and amounts being: Daly West, 2,440; Ontario, 562; Silver King, 1,639; Keith Kearns, 672; American Flag, 126; Uintah Treasure Hill, 20; Daly-Judge, 1,889; other mines, 1,208 tons.

The directors of the Lower Mammoth Mining Co.

operating in the Tintic mining district, have posted the second regular monthly dividend amounting to $9,500.

At a meeting of directors of the Newhouse Mines & Smelters Corporation to be held within the next month, the first dividend will be declared. It is believed that it will be 50 cents per share, or at the ratio of $2 per annum. It is the intention to build up a surplus and cancel the bonds of the company.

Mexico City.

The Smelting Business of Chihuahua.—The Rio Tinto Plant.—A Big Smelter at Chihuahua.—The San Toy Co.—Plans of the United States People.—Mining News From Parral.

In the State of Chihuahua the 250-ton smelting plant of the Rio Tinto mines at Terrazas, the resumption of which was made possible by the high price of copper, has been continuously in blast with excellent results since October last, shipping its product of about seven tons of copper matte daily to the Aguascalientes plant of the American Smelting & Refining Co. It is understood that when the latter company completes its plant near the city of Chihuahua, the Rio Tinto smelter will be closed down, as it will be more advantageous, with such a short railroad haul, to sell the ore to the A. S. & R. Co. than to continue to run the little plant at Terrazas. The Chihuahua smelter of the A. S. & R. Co., which is planned to be of 800 tons daily capacity, with room for enlargement, is being pushed toward completion; the principal buildings are almost all erected, and S. W. Eccles is quoted as saying that all will be ready for business in October of this year. That there is ore plenty for this plant is shown by the fact that the A. S. & R. Co.'s shipments from Chihuahua, even with the present shortage of railroad cars, amounted to between 400 and 500 tons per day, which could be greatly augmented if cars were available; besides, there is any amount of ore that cannot stand the freight to distant points, such as El Paso, Torreon, Velardeña, or Aguascalientes. When this Chihuahua plant was first started, the work proceeded in a rather desultory fashion, apparently with the idea of discouraging the building of smaller plants in the vicinity. This condition continued until the San Toy Mining Co., which had obtained large holdings in Santa Eulalia, began to talk of building a smelter at Chihuahua; then the A. S. & R. people waked up and hurried the erection of their own plant, and it is believed now that the San Toy company has abandoned the idea of entering the smelting business. This threatened competitor was no small affair, for though it is a company of but $6,000,000 nominal capital, its holdings in Santa Eulalia include the Juarez, Central, Septentrion, Peruana, Quien Sabe, Bustillos, and Galeana, and it is controlled by Charles M. Schwab and associates, whose millions would see a thing through once started, and who are not new to the smelting business. It well behooved the American Smelting & Refining Co. therefore to move. The San Toy company has just started the construction of an 8-kilometre railroad from Alberto (the A. S. & R. Co. smelter station on the Mexican Central), to connect with the aerial tram that brings the ore from its Santa Eulalia mines, a distance of four and one-half miles.

Map of Mexico.

The persistent rumors that the United States Smelting, Refining & Mining Co. was preparing to enter the smelting field of Mexico seem to be taking material form. The purchase by this company over a year ago of the Real del Monte, at Pachuca, cannot be looked upon as a part of the plans with the smelter idea in view, but it is known that some of the principals in the United States Co. are behind a certain ore-purchasing concern in Mexico City, which it is expected will act as agents if the smelter or smelters are erected. Within the last year also some consideration has been given to the plan of renting the San Rosalia (Chihuahua) plant of the Encinillas Mines, Ltd., but the English owners of the latter have not sense enough to see the wisdom of entering into such a scheme. The advisability of taking up a concession held by a Parral group of mining men for the erection of a smelter at Jimenez, Chihuahua, is likewise being

seriously considered. And within the past month it is understood, from a source that is usually looked upon as reliable, that the United States people have taken an option on, or closed a deal for, the purchase of the mines and railroad of the Naica Mining Co., of Naica, Chihuahua. This is one of the largest and richest mines in the State of Chihuahua, and could itself furnish sufficient lead ore for a good sized smelting plant. The figure at which the transaction is said to have been carried through is placed at $5,000,000 gold.

The Ricamole mine has recently opened up some good ore, and several shipments were made. This property, which lies in the Parral district, and close to the famous Palmilla, was denounced only a year ago. The workings consists of a 20-metre vertical shaft, with over 200 ft. of drifts and 100 ft. of cross-cuts. The vein is over nine metres wide, and during the development work they have taken out much high-grade ore, some running as high as six kilo. silver per ton. No machinery has so far been erected, as it is the intention of the owner, Leopoldo Iwonsky of Parral, to develop the mine first. The Mascota is now being worked with good results. This property lies in the northern part of the Minas Nuevas district. The vein is wide, being over 15 ft. The ore is silicious, the main value being in silver. The workings consists of three shafts, the deepest not over 20 metres. At the present time they are working only the south shaft. Mr. Garcia, the owner, states that he expects soon to begin shipping the ore which is taken out during development.

At the Palmar mine work is being pushed rapidly, and thus far consists of 130 metres of tunnel work, and two 100-ft. winzes. By this tunnel two veins have been cut, one five feet wide and the other 11 ft. wide. Both of these veins show good value in silver. The mine lies close to, and south of, the Palmilla, and is now being operated under the Palmar Mining Co. The main offices are in Chicago, and the work at the mine is under the management of Sr. Manuel Aguilera of Parral. It is the intention to equip the property for electric power in the near future. The officers of the company are D. W. Grubbs of Harrodsburg, Ky., president, Paul H. Seymour of Chicago, secretary, C. A. Bowton, treasurer.—— The Maria mine, one of the old and best known properties of the Roncesvalles district, is again being operated, after being closed down for over three years. This property is owned by Louis Phelan of Parral, and is at the present time shipping over 50 tons of ore per week, but this will be increased to 500 tons per month in the near future. The ore is a silver-manganese ore, containing also lead and gold. The average shipping ore will run 1,200 gm. silver, with five grams gold, per ton. The workings are now down to the 300-ft. level.

Calumet, Michigan.

Copper Mining in Ontonagon.—The Baltic Lode on the Lake Co.'s Property.—The Adventure's Prospects.—Mass Consolidated.—The Michigan and Its New Mill.—Good Work at the Victoria.

This promises to be a most active season in Ontonagon county. The discovery of what is supposed to be the Baltic lode on the property of the Lake Copper Co. has awakened a great deal of interest. The Lake company extracted several diamond-drill cores from the lode and most of these showed copper in encouraging quantity. It is the purpose of the company to start a shaft on the Baltic lode. The overburden at the site of the proposed shaft is only four or five feet thick and little difficulty is anticipated in getting the shaft down into the lode.

While the outlook at the Adventure is discouraging there is still some hope; the company is preparing for diamond-drilling near Peppered Junction, where it is hoped that the supposed Baltic lode will be found. The stand-pipe for encasing the drill has been sunk to a depth of 155 ft. without encountering solid rock. This indicates that the overburden is thicker than indicated by an earlier investigation. Work at the Adventure mine is now confined to No. 3 shaft, operations at No. 4 having been discontinued some time ago. About 30 drills are in use at No. 3 and the mine is employing a force of 325 men. During the spring some trouble was experienced because of the heavy inflow of water. The work underground in No. 3 is mostly in the openings east of the shaft. These go under a big depression in the surface, which is traversed by a small river, consequently the workings make a good deal of water. The company has striven for several years to make a successful mine in the old workings, but from present indications these efforts are doomed to failure. However, if a promising lode is revealed by the diamond-drill work, there will still be some hope. The company has a modern stamp-mill and mine equipment that could be readily utilized in the development and operation of any new workings on the supposed Baltic lode.

At the Mass Consolidated the outlook has improved and the mine is understood to be making a nice profit.

The new C shaft is furnishing more rock than either of the other two shafts. The management has installed an economical system for handling the rock at C shaft, something along lines not heretofore used in the Lake district and a big saving has resulted. Since the second stamp (formerly used by the Michigan) was remodeled, the production has been increased and every effort will be made to enlarge the ore shipments to the mill without lowering the quality.

Surveyors are now at work on the Riddle farm, owned by the Mass company, laying out lines for the diamond-drill work, which is intended to explore for the Baltic lode.

While the Michigan has not taken any steps toward finding the Baltic lode on its land, there is abundant evidence that the company has some prospects of getting this formation within its boundaries. The Michigan owns a large territory and the result of the explorations on the Mass Consolidated at Riddle farm will be awaited with keen interest. The Michigan is devoting attention to the development of its easterly opening, where the showing is encouraging. Ore shipments average about 550 tons daily, being forwarded to the Atlantic mining company's mill on Lake Superior. Work on the Michigan's new mill at Keweenaw Bay is progressing steadily and the Wisconsin Bridge & Iron Co. of Milwaukee, which has the contract for the structural iron, expects to complete its portion of the plant this month. The mill is to be completed by next fall, when a material increase in the production will be possible. The net earnings of the mine are expected to be sufficient to pay for the new mill and other improvements without any call upon the stockholders. At the Victoria there has been some increase in production as a result of the remodeled stamp being in use. The power-plant is working satisfactorily and the operating expeuses are low. The Victoria management is considering the advisability of starting diamond-drill work to find the Baltic lode on its property. A representative of the firm of Cole & McDonald, of Duluth, was at the mine recently to figure on the work.

Butte, Montana.

Earnings of the Mines.—Interesting Figures.—The Parrot Shaft.—Prospects in Depth.—Butte Exploration Suspends Work.—Butte & London.—Amazon-Butte Assessment.

The net earnings of the mines of Butte during the year ending June 1, 1907, were $20,000,000, an increase over the previous year of $2,611,273. In the annual statements of operations, filed with the County Assessor for the purpose of taxation on net earnings, the Boston & Montana, Anaconda, North Butte, Coalition, and Butte & Boston companies show material increases. Both the Trenton and Parrot companies show decreases, while the Washoe, as usual, shows a loss, as more than its earnings were spent in improvements at the Washoe smelter at Anaconda and at the mines. The Clark companies, and several minor operators, have yet to make their reports, but taking estimates for the missing reports, the figures are as follows:

Companies.	1906.	1907.	Increases.
Boston & Montana	$ 6,158,110	$ 7,049,988	$ 891,878
naconda	5,753,265	5,819,184	55,919
& Boston	1,075,890	1,249,467	173,577
rrot	277,015	141,730	*135,284
renton	541,530	481,623	*59,906
North Butte	1,848,010	3,271,213	1,423,203
Coalition	1,035,205	1,432,760	397,555
Clark mines	648,490	†650,000	2,000
La France	149,985	†200,000	50,015
Miscellaneous	2,195	†5,000	2,805
Total	$17,489,695	$20,100,968	$2,611,273

* Decrease. † Estimates.

The Washoe shows a loss, that is, expenditures in excess of receipts and earnings, of $266,973. The Pittsburgh & Montana also operated at a loss last year, and so did the Alice, as is shown by the latter's statement. The Pittsburgh & Montana Co. made no statement.

The Parrot Silver & Copper Co. has resumed sinking on the shaft of the Parrot mine, which is now down 1,875 ft. Work on the shaft was stopped some months ago, and was only resumed last week. For more than a year the Parrot has been working in the lean zone, through which all the big mines of the Amalgamated passed before encountering the zone of secondary enrichment. The richest ore in the Anaconda mine has been found on the 2,200 and 2,400-ft. levels, and the 1,800-ft. level of the Parrot is at about the same depth on the vein as the 2,100-ft. level of the Anaconda. Therefore, it is the belief that a few hundred feet will bring the Parrot to the orebodies opened in the lower workings of the Anaconda, both mines being on the same vein, the Parrot lying a short distance south and west of the Anaconda. The Parrot is mining about 400 to 450 tons of ore daily now, but it is not high-grade, the average being 60 lb. copper per ton. The company has also been doing development work on the Little Mina and expects to produce ore from that property before long. The shaft is 900 ft. deep and a cross-cut has been started toward the vein. H. A. Gallwey, who was added to the board of directors, is superintendent of the Parrot, and an exceptionally capable man.

There is talk of a possibility of a reorganization of the Pittsburgh & Montana Mining Co. The bonded and floating debts of the company are about as much as the property is worth, and the debt is constantly increasing. The company is earning from $60,000 to $65,000 per month, but the expenditures are said to be about $75,000 per month. It is claimed that the Pittsmont property has been badly managed, and the money of the stockholders frittered away in experiments on new-fangled smelting schemes. It is claimed that the development work underground was also done with poor judgment, and a lot of expensive work was uselessly duplicated in a number of instances. The present management of the company has been doing some intelligent development work, and while doing so it has attempted to make the mines pay the cost.——The Tuolumne Copper Co., which is developing a claim adjoining the Speculator, is cross-cutting north and south on the 600-ft. level, and has struck some fine copper-silver ore in the south cross-cut, about 50 ft. from the station. Sinking has also been resumed and the shaft will be carried to a depth of 1,000 ft. as speedily as possible. It was at that depth that the Speculator disclosed its big orebody.

The Butte Exploration Co. has pulled the pumps out of the Six O'Clock mine, which is taken as an indication that the company intends to abandon the property and permit the options to lapse. No information can be obtained by Butte stockholders. One option, on a claim called the Water Witch, has been permitted to lapse after the company had paid $1,200 on it. The officials live at Boston and Chicago, and the orders to pull the pumps came from them. The action caused a great deal of surprise and disappointment, especially among those who purchased stock under the impression that the company owned the property. It now develops that the company had only $150,000 with which to operate, although the promoters of the company are worth many millions. The $150,000 was derived from the sale of stock at $1.50 and $3 per share. The money did not go far in paying for exploration work, and when ore was not found, work was stopped.

The shaft of the Boston & Montana on the Greenleaf,

just south of the Six O'Clock, has reached a depth of more than 1,000 ft. A station has been finished and a pump is being installed. Sinking will be resumed during the coming week. The conditions of the Butte & London are different from those in the Six O'Clock, and the failure to find ore in the latter in no way affects the chances of the Butte & London. The Six O'Clock has to contend with what is known as the Continental fault, while the Butte & London is situated west of the fault.

The Amazon-Butte Copper company has notified its stockholders that at a recent meeting of the board of directors and "the largest stockholders" it was decided to make the stock assessable, and that an assessment of five cents per share has been levied, payable before June 23. The action of the directors was unknown to the small stockholders until the notice from the company was received. The company explains that it was decided to levy an assessment in order to continue development work, rather than sell treasury stock during the present dull market.

Joplin, Missouri.

High Prices for Zinc and Lead.—Large Production.—Five New Mills Started.—Transfers and Leases.—Several Strikes of Ore.—Drilling Operations.

The high price of zinc ore for the past two months has been $50 to $51 per ton, the assay basis ranging from $45 to $47.50 per ton of 60% zinc. There has been but little change in the market. Lead ore has been selling for $82 to $83.50 per ton and holding very strong. A heavy rain on May 13 inundated the mines at Badger-Peacock, cutting off 300 tons per week, but five new mills in the Webb City-Duenweg portion of the district have made up that shortage, so the shipments have not suffered thereby.

	Zinc.		Lead.		Combined
Shipments.	Lb.	Value.	Lb.	Value.	Value.
Month of May.....	49,301,740	$1,138,153	8,064,600	$320,069	$1,458,222

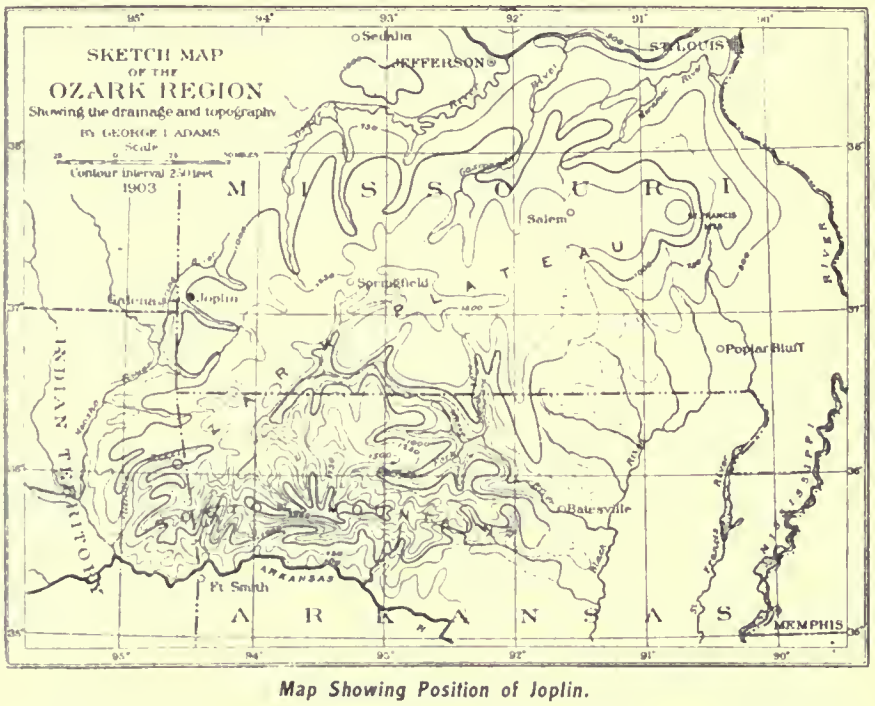
Last week marked the largest new production in the history of the district. Five new mills started in the vicinity of Webb City and Duenweg, and their production was close to 300 tons of ore. These mills are all modern in every respect and all of them have exceptionally rich material to work on, so that they are sure to enlarge their production in the next few weeks, or as soon as the 'new' wears off, as the saying goes. The new mills and their production was as follows: The Church-Mitchell, near Prosperity, 169,110 lb. of zinc; Luke & Ash, Prosperity, 107,420 lb. zinc and 7,750 lb. lead; Alabama, at Porto Rico, 101,480 lb. zinc; Rhea Lead & Zinc Co., Webb City, 61,070 lb. zinc; Hyde Park, near Duenweg, 35,860 lb. lead; Ice Plant Co., Webb City, 17,270 lb. lead. The Church-Mitchell had two cars of ore in the bin that could not be loaded and the Luke & Ash had one. The Big Three on the Marion B. lease started up the middle of the week but did not make a turn-in. These mills will add three to four hundred tons per week.

The Kramer Mining Co., operating north of Carl Junction, where they have a 300-acre lease, has purchased an undivided one-half interest in the 200-acre farm of J. W. Burgess, which adjoins their lease, the consideration being $25,000. This tract has been fully developed by drilling, nearly every hole showing the same run of ore, which was encountered at a depth of 175 ft. and continued to a depth of 225 ft. In sinking a shaft, the ground was found to be a sheet formation, more like the Webb City district than anything yet found in the Missouri-Kansas region. This company last week let the contract with F. W. Caulkins of Webb City for a 500-ton concentrating plant at a cost of $30,000.

The Lucky 8 Mining Co., operating on the old Allen Hardy farm northeast of Webb City, has made a second rich strike, the drill penetrating the ore for a distance of 30 ft. They have one shaft down in the ore.——The Sycamore Mining Co., of Joplin, has sold its property, consisting of a lease on 18 lots, on the south part of the Rex Mining & Smelting Co., east of Joplin, to W. H. Locker of St. Louis; the consideration is said to be about $100,000. Mr. Locker is the principal stockholder in the Quality Mining Co., whose land adjoins the lease just purchased. Developments will be pushed forthwith.—— The Rex Mining & Smelting Co., operating southeast of Joplin, and one of the largest producing companies in the district, is making arrangements to do some drilling. The company intends to drill to a depth of 600 ft. in several holes just to test the land for its deep mineral possibilities. The first hole will be put down north of the company's big mill. Other companies are also putting down some deep holes.



Map Showing Position of Joplin.

The Maggie Taylor mining tract, in the southeast corner of Galena, is now exhibiting a great amount of activity. This is caused by a number of rich strikes of ore at a deep level.——Articles of association have been filed by the Empire State Mining Association at Joplin. The capital stock of the company is $100,000, divided into 1,000 shares of the value of $100 each for a term of 50 years. The company has secured a lease of 10 acres on the Elliott & Zimmerman land just south of Webb City, and 40 acres on the Carter land north of Webb City, where they will commence drilling operations on a large scale. It is intended to drill about twelve holes on the leases and when the ground has been sufficiently tested a modern concentrating plant will be erected.

Concentrates.

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

CRIPPLE CREEK has produced $225,000,000 in gold, produced from workings, the maximum depth of which is 1200 feet.

THE explosion of nitro-glycerine is much sharper than that of gunpowder, because the oxygen in it is mixed with the combustible in a much more intimate way.

ON THE Yuba river dredging is done to a depth of 72 ft. below the water-line. This is the greatest depth to which dredging for gold has been carried successfully.

THE employment of copper sulphate to kill germs in drinking water has not found favor in New England. Tests made at Manila have also proved unsatisfactory.

NEITHER cyanide nor any other chemical is required for the ordinary dressing of the plates in a stamp-mill, provided sufficient amalgam is left on the plates after the clean-up. It is false economy to scrape the amalgam off the plates too closely.

AFTER gold has been dissolved in cyanide solution it is recovered by precipitation on zinc shaving, or it is precipitated by zinc dust, the resulting slime being melted with flux in a crucible. The bullion thus obtained is subsequently refined.

IN REGIONS where water is scarce and where copper mines are in operation, it may be estimated that 300 gal. water per ton of ore will be required. Of this amount, 240 gal. will be needed for power and treatment of the ore, and 60 gal. for domestic purposes.

DRILLING through gravel, preparatory to dredging, costs $2.50 per foot; the cost of shaft-sinking by the China method varies between 90c. and $1.50 to water-level, and below this the expense depends upon the influx of water and the consequent pumping.

THE imports of lead into Great Britain declined from 229,500 tons in 1905 to 208,200 tons in 1906, while the exports for the year fell from 60,500 tons to 58,400 tons. The consumption of lead in Great Britain showed a decrease of over 25,000 tons compared with 1905.

FOR dressing amalgamated plates, a solution of hydrochloric acid of 1.6% strength (or 1 in 20 when using commercial spirits of salt) makes a good substitute for the cyanide solution generally used. The cyanide dissolves gold and is a cause of loss in the water passing over the tables.

THE problem of the calculation of the pressures on ore-bin walls is the same as the problem of the calculation of pressures on retaining walls. The forces acting on bin walls depend upon the weight, angle of repose, moisture, etc., of the material, which are variable factors, but are less variable than for the filling of retaining walls. The graphic solution is the simplest and most direct for any particular case.

CONCRETE reinforced with steel or iron has been extensively used in retaining-wall construction. Retaining-walls of reinforced concrete may be built with a spreading base and a thin vertical section, or with a thin vertical section strengthened by buttresses or counterforts. Their principal advantage over a plain concrete wall is the saving of material in substituting a thin reinforced wall for the gravity section and in substituting earth filling on the back of the footing in place of expensive concrete.

EXPLOSIVES are made by obtaining oxygen in some concentrated form and mixing it with a combustible, so that the latter can be burned instantly, without the necessity of obtaining the oxygen for its combustion from a large quantity of air. The gases generated by the combustion and expanded by its heat, give the force to the explosion.

MOLYBDENUM is used for the same purposes as tungsten, but not so extensively, as it is harder to get in the pure state and is not as plentiful. It is used in steel making, but is more difficult to alloy with steel because of its liability to oxidize and volatilize. The chief ores are molybdenite and wulfenite. The present wholesale price of metallic molybdenum running from 98 to 99%, is about $1.75 per lb. f.o.b. works.

THE salt deposits of New Mexico thus far reported are in the shallow lake basins which are to be found in several places in the Territory. Probably the largest of these is in the west-central part of the Territory, 80 miles south of Gallup, on the main line of the Santa Fe railroad. The water contains about 26% of salts, mostly NaCl, and the supply is kept up by springs which are believed to rise from the Red Beds, which are usually salt-bearing.

IT IS undoubtedly true that in the manufacture of a high-speed tool steel the most satisfactory results will be obtained by using the best qualities of iron, which are free from impurities, and by using the highest grades of the various alloys and metals. In melting the steel and in adding the metal or alloy, care must be taken that the metals are thoroughly alloyed, and that the resulting alloy is homogeneous. The annealing process should also be carried out carefully, as this has a tendency to make the steel more uniform in regard to its molecular structure, relieving internal strains which may have been produced by casting and tilting.

WHEN silver plating is scraped off an amalgamated plate, either by wear or intentionally, the surface underneath is not as well fitted to receive a new coating of amalgam as a new copper plate that has never been electro-plated. The saving of gold is effected by the gold amalgam on the copper plate and a good coating of such amalgam is necessary to make the plate an efficient gold-saving device. It is more difficult to keep plain copper in condition than the silver-plated copper, but when both are in first-class order there is little to choose between them. In using electro-plated copper it is well to have it heavily plated, since a thick coating will last longer and tend to maintain a good amalgamating surface.

THE materials grouped under the head of mineral paints include such iron ores as are ground and used in the manufacture of metallic paints; ochres and other clays rich in iron, which are used for the yellow and brown pigments (ochre, umber, sienna), and which are occasionally roasted to give red pigments; and fine-grained slates and shales of attractive colors, which are ground for use as paints. Many other minerals or mineral products are used in the paint trade, such as graphite, chrome, whiting, talc, asbestos, and barite. Other paints, as venetian red, litharge, white lead, orange mineral, etc., are purely chemical products. Zinc white is made directly from the ore, without previous metallurgical processes.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy.

A Celebrated Case.

The Editor:

Sir—I have read with much interest the article by Mr. Hoyt appearing in your issue of June 1, and I desire to offer some comment.

The case of Lavagnino *v.* Uhlig was an adverse suit on behalf of Yes You Do claim against Uhlig No. 1 and Uhlig No. 2 claims, for which patent had been applied, the trial court excluded from evidence plaintiff's notice of location of the Yes You Do claim on the ground that the location was invalid because made by a Deputy U. S. Mineral Surveyor. Plaintiff then rested.

The defendants then proceeded to introduce evidence in support of the validity of Uhlig No. 1 and 2 mining claims; after which, in rebuttal, the plaintiff offered to show that the Levi P. and Veta mining claims, at the time of the location of Uhlig No. 1 and 2, were valid and subsisting claims and covered the discoveries of both Uhlig No. 1 and No. 2, and were then owned by Andrew P. Mayberry. Mr. Sonnedecker, an attorney of the plaintiff, offered the same "on behalf of the Government and as a friend of the Court." The Court sustained an objection to this evidence on the ground that no adverse claim had been filed on behalf of the Levi P. and Veta claims, and that plaintiff was no longer a party to the proceedings.

The Supreme Court of Utah, from whose statement of facts the above is quoted, after holding that the Yes You Do location was void, because made by a Deputy U. S. Mineral Surveyor, says:

"The failure of the plaintiff to show, in chief, any right to the premises in controversy, disclosed the fact that he was 'a stranger to the title' of the premises in dispute, and that a non-suit could, on motion, have been properly granted."

And also says that, even if the location of the Yes You Do claim had been made by one competent, an action on behalf of the Levi P. and Veta claims was barred by the statute of limitations, the Uhlig No. 1 and 2 having been held and possessed for eight years.

On appeal to the Supreme Court of the United States, 198 U. S., 443, the judgment was affirmed, though on different grounds. Mr. Justice White, who wrote the opinion, says, in overruling a motion to dismiss:

"It is evident from the record that the findings of the trial court as to the time when possession was taken of the Uhlig No. 1 and 2 claims, and the duration of possession, was based entirely upon the evidence introduced on behalf of the owners of those claims."

In the opinion, Mr. Justice Brown assumes

"For argument's sake, that the section of the Revised Statutes relied upon, and the rules and regulations of the Land Department, did not prohibit a Deputy Mineral Surveyor from making a location of mineral land;"

And concedes

"For the sake of argument, that the Levi P. location, of which the Yes You Do purported to be a re-location, was prior in date to the location of the Uhlig No. 1 and 2, and that there were areas in conflict between them. With all these concessions in mind the question yet remains whether Smith and his transferee, in virtue of the location of the Yes You Do, stood in such relation as to enable them, or either of them, to successfully adverse the application for patent made by the owners and possessors of the Uhlig locations."

He thus explicitly strips the case down to the following proposition:

"The question then is, where there was a conflict of boundaries between a senior and junior location, and the senior location has been forfeited, has the person who made the re-location of such forfeited claim the right, in adverse proceedings, to assail the title of the junior locator in respect to the conflict area which had previously existed between that location and the abandoned or forfeited claim?"

He then states the proposition somewhat differently, as follows:

"In other words, the proposition must come to this—that as the junior locator had acquired no right whatever, present or possible, by his prior location, as to the conflicting area, he would be obliged, in order to obtain a patent for such area, to initiate in respect thereto a new right, accompanied with a performance of those acts which the statute renders necessary to make a location of a mining claim."

And, evidently led astray by the proposition as he last puts it (which might or might not be true, according to circumstances), he decides his first proposition (which, in view of his concessions, was the question before the Court) in the negative.

The Supreme Court of Idaho, in Ambergris M. Co. *v.* Day, 85 Pac. 109, and the Supreme Court of Utah, in Farrell *v.* Lockhart, 86 Pac. 1077, express the hope that the Lavagnino case can be distinguished from the rule laid down in Belk *v.* Meagher, which has stood the test of time both in principle and practice.

That it will be distinguished there is little doubt, but no amount of legal differentiation will satisfactorily explain the Lavagnino opinion. The case must have been sharply debated by the justices, because Mr. Justice McKenna dissents, Mr. Justice Brewer concurs in the result, and Mr. Justice White goes out of his way to nail down and clinch his original proposition, to expressly state that Section 2326 qualifies Sections 2319 and 2324 to a greater extent than most lawyers concede, and to call the text-book writers to account.

Mr. Justice White makes the point that the contrary doctrine advanced by the text-book writers is founded upon cases decided "before the passage of the adverse claim statute of 1872, or concerned controversies between senior and junior locators, or depended upon the provisions of State statutes." None of the qualifications apply to Belk *v.* Meagher; and, furthermore, the adverse claim statutes of 1866 are, in effect, the same as those of 1872. 'Lindley on Mines,' pp. 1627 and 1628.

But, it would seem, the Supreme Court of the United States, in the case of Brown *v.* Gurney, 201 U. S. 184, has restored the doctrine of Belk *v.* Meagher, in so far as the same had been weakened by Mr. Justice White's handling of the Lavagnino case; without, however, mentioning the Lavagnino case, though that case was cited on the brief of attorneys for plaintiff in error.

Mr. Chief Justice Fuller, who writes the opinion, which is a unanimous one, emphasizes the principle:

"Of course it is essential that at the date of a location the ground located on should be part of the public domain, and in the present case the specific question affirmatively raised was whether the ground in controversy was a part of the public domain at the time of the respective contested locations."

And says further:

"The election, then, by the Kohnyo claimant, filed in the Land Office June 14, 1898, was an abandonment of the south seven hundred feet of the Kohnyo claim, which took effect *eo instanti* Lindley, pp. 642, 643, 644; Derry *v.* Ross, 5 Colorado, 295, 300. This was voluntarily done, and took effect notwithstanding the Receiver's receipt had not been formally cancelled. The order of cancellation of July 15 simply recorded a pre-existing fact, and did not change the effect of the previous abandonment. By reason of that abandonment the southerly tract, for the first time, reverted to and became a part of the public domain. And as the Hobson's Choice was the first location of the ground made after such abandon-

ment, it follows that it was valid, and that its owner was entitled to a decision in its favor.

"We again state the dates of the respective locations. The Scorpion was located May 13, 1898. The Hobson's Choice was located June 23, 1898. The location of the P. G. was July 16. Thus it is seen that the Scorpion was attempted to be located at a time when the premises were not subject to location; that the Hobson's Choice was located when the premises had reverted to the public domain; and that the location of the P. G. was after that date."

The Chief Justice also makes the point that "the discovery shaft of the Scorpion was upon ground covered by the Kohnyo's claim." This latter fact existed in the Lavagnino case, and was mentioned by the Supreme Court of Utah in its statement of facts, and the point was made on the brief of attorneys for plaintiff in error, but was not referred to by Mr. Justice White; it must have been considered, though, under the rule as laid down by him, it would be immaterial whether or not the discovery was involved.

The Supreme Court of Utah, in the late case of Lockhart *v.* Farrell, 86 Pac. Rep. 1077, wherein the same question was involved, relies largely upon the fact that Farrell's discovery was made upon the South Mountain claim, which, at the time, had not been forfeited.

The facts in this case are as follows: The South Mountain was located August 21, 1900; the Cliff, Farrell's claim, on August 1, 1901; and the Divide, plaintiff's claim, January 2, 1903; all covering the same fraction. The Cliff applied for patent and was adversed with the Divide; no adverse was filed for South Mountain, which was forfeited January 1, 1902, for failure to perform annual labor. The trial court held, under the doctrine of the Lavagnino case, that plaintiff was not entitled to prove that at the time the Cliff was located the ground was held by the South Mountain location. The Supreme Court reversed the lower court and ordered judgment entered for plaintiff. The Supreme Court distinguishes the Lavagnino case, and follows the case of Brown *v.* Gurney, saying, in conclusion:

"Giving the Lavagnino case the construction contended for by the respondent is, in effect, to make it overrule Belk *v.* Meagher, and Gwillim *v.* Donnellan, and to render it in conflict with the decisions of both Federal and State courts on the question. We do not believe any such result was intended by that decision. Likewise to give it the meaning contended for renders it in conflict with the more recent decision of Brown *v.* Gurney. Whatever room there may be for the contentions (Ambergris Min. Co. *v.* Day, Idaho, 85 Pac. 109, and Wilson *v.* Freeman, 68 L. R. A., 842, note 5), that the Lavagnino case is in conflict with or distinguishable from prior decisions, it is sufficient for us that we follow Brown *v.* Gurney more recently decided, and which more nearly applies to the facts of the case at bar."

Farrell *v.* Lockhart has been appealed to the Supreme Court of the United States, and, if affirmed there, as may be expected in view of Brown *v.* Gurney, the air will be clear again.

Mr. Dey, who was of counsel for appellant in the Lavagnino case, is now appealing the Farrell case to the Supreme Court of the United States. He contends that the Farrell case is on all fours with the Lavagnino case, and that the Supreme Court of Utah misconceived the principle involved in Brown *v.* Gurney. He distinguishes Brown *v.* Gurney on the ground that at the time the Scorpion location was made the land could not for any purpose be deemed a part of the public domain, having been withdrawn by the issuance of the receiver's receipt for the Kohnyo; that, therefore, it was no more subject to location than if patent had been issued, and that fact could be shown by a later locator.

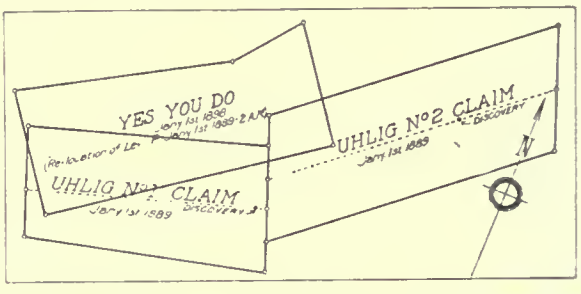
Chief Justice Fuller says in Brown *v.* Gurney:

"Of course, it is essential that at the date of location the ground located should be a part of the public domain;"

and also says that the "specific question affirmatively raised" by that case "was whether the ground in controversy was a part of the public domain at the time of the respective contested locations."

Now the question whether the ground in controversy was part of the public domain was affirmatively raised in the Lavagnino case, in the same manner as in Brown *v.* Gurney, if we accept the premises of Mr. Justice White.

In Brown *v.* Gurney, the ground was under location as the Kohnyo (owned by Cripple Creek Mining Co.), on May 13, 1898, when Brown located the Scorpion; on June 14, 1898, the Cripple Creek Mining Co. filed in the land-office an abandonment of that portion of the Kohnyo, and on June 23, 1898, Gurney located it as the Hobson's Choice. The Scorpion applied for patent and the Hobson's Choice adversed; the Kohnyo claimant did not appear. The issue was thus raised as to whether the ground was open to location on May 13, 1898; but, under the Lavagnino doctrine, how could the claimant of the Hobson's Choice be allowed to prove that on May 13, 1898, the ground was not a part of the public domain? Relatively, the Kohnyo occupied the position of the Levi P., and, since the Kohnyo did not adverse the Scorpion, "the conclusive presumption" was in favor of the latter; the Hobson's Choice being in the position



of the Yes You Do, and therefore not permitted to prove that, when the Scorpion was located, the ground was held by a senior valid location. The fact that a receiver's receipt had been issued to the Kohnyo is not material; the receipt was shortly afterward cancelled, the books of the land-office were clear, and neither the Kohnyo nor the Government had any interest in the controversy. Furthermore, it was the Kohnyo claimant's act of abandonment which left part of that claim open to location, not the cancellation, which took place after the Hobson's Choice had been located.

In the language of the Chief Justice:

"By reason of that abandonment the southerly tract, for the first time, reverted to and became a part of the public domain."

If "it is essential that at the date of location the ground located on should be a part of the public domain," why should not an adverse claimant, like Lockhart in the Farrell case, be allowed to show that at the time the Cliff location was made, the ground was not a part of the public domain, because covered by a valid location, just as he would be allowed to prove that the Cliff locator never made a discovery, or failed to mark his boundaries, or to record his notice of location?

Under the United States statutes, it is just as essential to a valid location that the land located belong "to the United States" (Sec. 2319), or be "situated on the public domain" (Sec. 2321), as that a discovery be made (Sec. 2320), or that the location "be distinctly marked on the ground so that its boundaries can be readily traced" (Sec. 2324).

Sec. 2324, after prescribing how a mining claim shall

be located and the amount of annual labor to be performed, says:

"And, upon a failure to comply with these conditions, the claim * * * shall be opened to re-location in the same manner as if no location of the same had ever been made." *Expressio unius exclusio alterius.*

It must be conceded that Sections 2325 and 2326, which treat of adverse claims, do qualify the above-mentioned statutes to a considerable extent. Section 2325 provides that:

"If no adverse claim shall have been filed within * * * the 60 days of publication, it shall be assumed that the applicant is entitled to a patent, * * * and that no adverse claim exists;"

which was construed in Wright *v.* Dubois, 21 Fed. Rep. 693 (Brewer, J.), to mean that

"If no adverse claims are presented it is conclusively presumed that none exist, and that no third parties have any rights or equities in the land."

Sec. 2326 provides that the failure of an adverse claimant to bring action within thirty days after filing his adverse claim, "shall be a waiver of his adverse claim;" which, with the preceding section, has been construed as qualifying the other statutes to the extent that one having a *prior valid location* will be deemed to have voluntarily waived his rights by failing to adverse. Seymour *v.* Fisher, 27 Pac. Rep. 240 (Colo.).

And these and other decisions seem to justify the statement of Mr. Justice White that Sec. 2326 thus clearly provides:

"That if there be a senior locator possessed of paramount rights * * * he may abandon such rights and cause them in effect to enure to the benefit of the applicant for a patent by failure to adverse, or, after adversing, by failure to prosecute such adverse."

But neither the statutes nor the decisions warrant the further deduction of the Lavagnino case, that the rights of a senior locator enure on abandonment or forfeiture, to a junior whose location was made at a time when the senior was a valid claim, *in a case where an adverse claim is filed and prosecuted by a third locator.*

Where an adverse claim *has* been filed and suit brought, there are no presumptions in favor of the applicant for patent; such as are absolutely necessary in order to clear title where no adverse is filed; or, if filed, is not prosecuted. In the language of Chief Justice Fuller, in Brown *v.* Gurney:

"In adverse proceedings each party is practically plaintiff, and must show his title."

In my opinion, therefore, Mr. Justice White's proposition should have been answered in the affirmative:

"The question then is, where there was a conflict of boundaries between a senior and junior location, and the senior location has been forfeited, has the person who made the re-location of such forfeited claim the right, in adverse proceedings, to assail the title of the junior locator in respect to the conflict area which had previously existed between that location and the abandoned or forfeited claim?"

GRANT H. SMITH.

Salt Lake, June 1.

Black Sands.

The Editor:

Sir—I came across a number of your journal recently in which you score a Mr. Day for misrepresenting the facts regarding the yield of gold and steel from black sand. I know nothing of Mr. Day, and shall say nothing about the gold, excepting that assays of black sand show much larger results than can be obtained from any process yet discovered. If a practical process could be invented for saving the gold, I think that great fortunes could be made on the sea coast of the State of Washington.

Thirty-five years ago E. F. Russell of San Francisco invented a process for saving the gold from black sand. He worked near the Cliff House on sand obtained there. He was an ingenious man, and, after he had been working some time trying to save the gold by a quicksilver process, the idea occurred to him that he might smelt the sand and afterward separate the gold from the iron. He failed to do so, but he did succeed in producing a fine quality of steel, some experts declaring it to be the finest known to commerce. The article was peculiar. It could be whittled almost like lead, but struck with a hard substance it gave out a clear bell-like sound. The Mechanics Institute had two razors made from this steel that were pronounced of superior quality. At the navy yard at Benicia a bell was cast from some of the same metal with results of the most gratifying nature. A manufacturer of pianos in the East, while on a visit to San Francisco saw some of this metal and pronounced it eminently fit for the manufacture of piano strings. Russell was a regular Col. Sellers in many respects, and had many schemes on hand. He died several years ago.

I know personally that the finest steel can be made from the black sand, and know that there is abundance of this sand in the ocean beach of the State of Washington, but know nothing of the matter commercially, and give the above information for what is worth.

C. P. FERRY.

Tacoma, April 30.

Insufficient Postage.

The Editor:

Sir—You will be conferring a great favor upon many English engineers and others if you will draw the attention of your readers to the frequent troubles caused us by the receipt of insufficiently stamped letters from the United States. As many of such letters only contain advertising matter, we have been compelled to adopt the custom of refusing to accept and pay the fines on all under-stamped letters unless the envelopes indicate that they are from friends.

It is impossible for us to understand why Americans should be so pre-eminently ignorant on postal matters.

HOOPER & SPEAK.

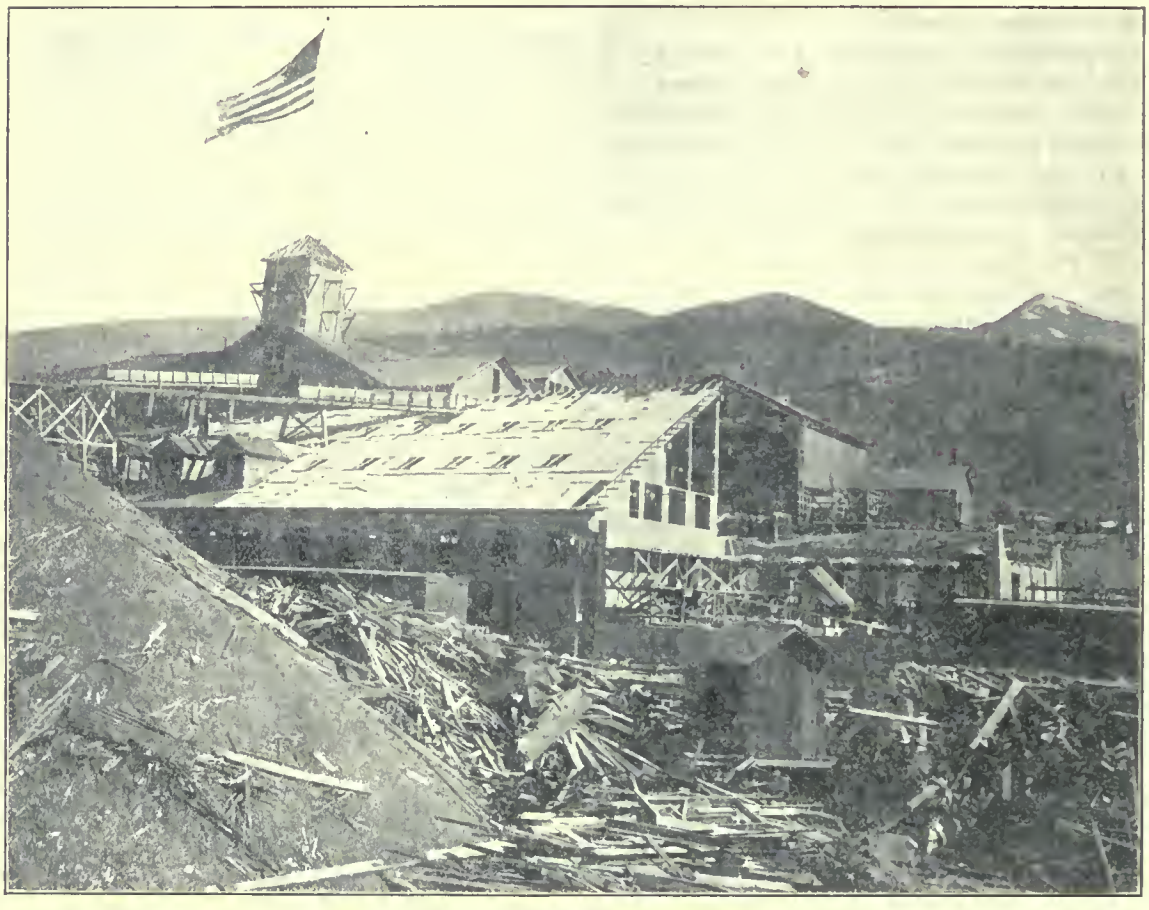
London, May 24.

SWISS ELECTRIC ENTERPRISE.—The Swiss hydro-electric enterprise of the Lake of Brusio, in the Canton of the Grisons, the machines of which were first set in motion on March 10, is without doubt the most important upon the Continent. The water of the Poschiavo river is caught at the base of Lake Poschiavo, which is used as a controller or regulator for the reservoir and conducted by a 3-mile conduit into the reservoir 1,378 ft. above the central station. From this reservoir the water is brought into the hydraulic station by means of five conduits fastened in the craggy rocks to a nearly vertical wall. The station now contains six groups of dynamos with, respectively, a force of 3,000 h.p. each. During this year there will be added four new groups, and in 1908 the two last, which will complete the installation and thereby enable the station to produce an energy of 36,000 h.p. A portion of this will serve to the needs of the Valley of Poschiavo and for the future electric railway of the Bernina. The contractors will reserve for themselves 16,000 k.w., and this power will be distributed in the industrial region south of the lakes of Como and Majeur by the means of a cable 100 miles in length. This great undertaking is the property of a Swiss company, and its installations are due entirely to Swiss industry.

The Troubles in the Coeur d'Alene.

The bloody atrocities perpetrated in northwestern Idaho from 1892 to 1900 are usually referred to as 'troubles,' the cynical humor of the term being emphasized by the accompanying photographs illustrating the destruction of the Bunker Hill & Sullivan Mining Co.'s mill. How this was done, has been told lately on the witness stand by Harry Orchard, a self-confessed murderer and assassin. According to his story, he himself lit one of the fuses that exploded eighty boxes (50 lb. each) of dynamite, destroying the concentrating mill with a roar that was heard twenty miles away. This was on April 29, 1899. The president of the Bunker Hill & Sullivan Mining & Concentrating Co. was (and is still) Frederick W. Bradley, a mining engineer of whom it is no formal compliment to say that he is one of the foremost men in an honorable profession; the manager at that time was Frederick Burbidge; the superintendent was Albert Burch, and the mill-boss was Edward Herrin. Mr. Burch is now at Boise, having been subpœnaed as a witness. Mr. Bradley himself was the victim of a dastardly attempt on his life, although this happened several years after the events recorded above. On November 17, 1904, at 7:40 in the morning, Mr. Bradley was about to leave the apartments at 1404 Washington St., San Francisco, when a bomb, placed there by Orchard, exploded beneath him. He first noticed that his cigar, which he had just lit, flared suddenly, so as to suggest a practical joke. Then, as he opened the door, there was a deafening explosion and a moment later he was hurled into the street. The occurrence was believed to have been an accident, due to a gas explosion, and the owner of the building brought suit against the San Francisco Gas & Electric Co., getting a verdict for $11,000—all that he asked. Now, however, it is stated by Orchard that it was nothing less than an attempt to kill Bradley, that Orchard had shadowed Bradley for weeks until he knew his regular habits and so was able to time the explosion of his bomb. Mr. Bradley was nearly killed and was expected to be either blind or deaf, but, most fortunately, he has recovered from the effects and is himself again.

In regard to the destruction of the mill, this was the culmination of a long quarrel between the management and the outside labor-unions (but not with its own employees), the company having steadily refused to recognize the union after the disorders and murders that occurred in 1892 and the years succeeding. In 1899 the Bunker Hill company was paying lower wages than the other companies in the district, although this was largely balanced by the fact that it had a dry mine, entered by an adit. Furthermore, this company had maintained then (as now) the distinction between skilled and unskilled workmen. The staff had always consisted of fearless men and the mine was big enough to warrant the retention of a number of engineers and millmen of high character, so that the representatives of the Bunker Hill & Sullivan had aroused the hatred of the unruly elements in the labor organization. On April 25 the company raised the scale of wages to that obtaining at the other mines but declined to recognize the union, even going so far as to discharge the few union men then in its employ. In consequence, when deviltry was afoot, the first object of it was the big mill at Kellogg. To give an idea of the condition of local government, it may be mentioned that the sheriff came to the superintendent and told him that he (the superintendent) would not be allowed to 'interfere' with any men that wanted to come to the concentrator and that he (the sheriff) could not protect the property. This was just before the mob took forcible possession of a train and came down from Burke with the purpose of killing the superin-



Bunker Hill & Sullivan Mill After the Explosion.

tendent and destroying the mill. The sheriff came with the mob. There were about 1,000 men on the train, led by half a dozen desperadoes. One third of them were masked and armed with rifles or revolvers. The superintendent was advised by telegraph and closed down the mill and mine. The train arrived at Kellogg at one o'clock, and within an hour and a half the two tons of dynamite were put in place and exploded. The other office buildings and the manager's residence were set on fire and destroyed. John Schmidt, who, with others, was sent up the hill to reconnoitre, was shot and killed by men on his own side, whether purposely or accidentally, is not known. All of the company's employees escaped, except three, namely, James Cheyne, a millman, R. R. Rogers, the stenographer, and William Huff, the assayer. They were subjected to gross indignities and then told to run; as soon as they started they were shot at, in Mexican fashion. Rogers was hit as he was climbing a fence, but survived. Cheyne fell in a hail of bullets and was rescued by Mrs. Ida Sinclair, only to die in a hospital at Spokane three days later. Huff jumped into the river and escaped. He is still working for the company. The mob returned on the train to Wallace at four o'clock that day and the other mines resumed work that night. Governor Steunenberg promptly appealed to President McKinley for troops, the State militia being then in the Phillipines. The rest of the story is pretty well known, and it need not be repeated. It is symbolized by the United States flag that flies from the top of the mill and flutters over the ruins, as shown in the accompanying photographs. The mill cost $250,000. It was promptly rebuilt and at the same time the company rebuilt the schoolhouse (at a cost of $10,000) and presented it to the community. Finally it may be noted that the employees whom the mob intended to deprive of their livelihood in Idaho are still pursuing their avocations with the Bunker Hill & Sullivan Mining & Concentrating Company.

Destruction by Dynamite Explosion.

BRAZILIAN CARBON SHIPMENTS.—There are many firms in Bahia, engaged in the business of purchasing carbons. These are either branches of French houses or they ship to firms in London and Paris on joint account, all the carbons bought here being thus shipped. Carbons are not brought to Bahia for sale, but are bought in the interior of Brazil by agents of the dealers, the latter advancing to the former large amounts of money at the several places in the producing districts. There are no companies engaged in mining or searching for carbons, that work being done by the natives, individually or in small parties working together. Prices are not controlled by any trust, but are governed by supply and demand and are subject to frequent changes. The carbon region begins about 267 miles from Bahia, and can be reached in four days, namely: Bahia to Cachoera, 45 miles by water, one day; Cachoera, to Bandeira de Mello, 158 miles by rail, one day; thence to Andarahy, 61 miles, on mule back, two days. There is a monthly steamer service between New York and Bahia, but between Bahia and British ports there are several steamers each week. Very little English is spoken in Bahia, and in the interior none but Portuguese is spoken. Owing to the facilities with which carbons can be smuggled out of the country, exporters are compelled to pay a tax for doing business, as follows: Firms exporting up to $150,000 annually, $1,500; exporting above $150,000, $3,000. In addition to this tax there is an export duty of 7% ad valorem.

THE Muho and Kuanying Shan gold mines in Heilungkiang, which have been restored to China by Russia on the repayment of the expenses incurred by the latter during the last several years, are said to be still rich, and may be again made prosperous if sufficient funds are put into the working of them. Owing to the threatened attitude of the large number of Hunghutze in the vicinity of Muho and Kuanying Shan, the mines are now guarded.

The Engineer and the Age.

By FRANK E. SHEPARD.

*The graduating engineer of twenty years ago little realized that in this time he would witness the practical application of such inventions as the electric street-railway, wireless telegraph, electric mine-haulage, hoisting and pumping, magnetic separation of ores, and similar wonderful developments, yet many of these great subjects were treated in '87 as interesting laboratory experiments, but hardly considered as practical successes. Many textbooks of '87 are today obsolete, the chemistry of twenty years ago tabulated 15 non-metallic and 49 metallic elements, today you have a knowledge of 78 elements. The contemplation of such remarkable changes may suggest to you the possible problems and the great opportunities to be offered in your own career.

Our honored Professor of History once stated: "Young gentlemen, I am aware that as students in engineering subjects, you have little time for my course, and I cannot expect to teach you much history, but I wish to teach you how to study history." Is this not the keynote of a technical education? We cannot expect in three or four years to become engineers, but we can establish systems that shall, in good time, make us engineers.

The stern discipline of the New England district school placed great value on the training of geometry. Some pupils would master the *principle* of the theorem, while others would commit to memory the sequence of letters relating to angles and lines, and sad would be the result for the memory students after the master used the alphabet in a different order. As engineers, it is essential that we should know the *principle*, rather than the sequence of the letters in our textbooks. Your laboratory experiments follow certain defined schemes, but practical work of one or two years may develop systems that are more direct. It is this special work that brings out the details so important in technical development. Persistent effort in one direction has accomplished great results, for example, the incandescent lamp and the phonograph mark the success attending the untiring energy of Edison. Westinghouse and his automatic air-brake have saved thousands of lives; MacArthur and Forrest in their cyanide process have created millions of wealth, and what could be accomplished in this age of steel without the bessemer and open-hearth processes? Pioneer explorations have opened the way for vast empires, pioneer thoughts have changed the methods of a world.

And now with all the strength from the training you have received, with the equipment of modern thought and apparatus, what will be the share each one of you will contribute to the strenuous progress of today? How can you bring yourself to the best efficiency and what will be your attitude in your profession and its relations to commercial life?

Only a few years ago all engineers were divided into two classes, military and civil; now there are dozens of divisions, and scores of sub-divisions, each branch of industry requiring the attention of its specially trained men. Formerly the idea prevailed that the engineer should devote his entire attention to matters of technical detail, while financial responsibilities were delegated to the business men. Today the schedule of studies in the technical schools shows careful attention to works-management and the most economical handling of financial questions in great installations. Not only must you be able to design your work, but you must install your plant with the least possible outlay for the greatest efficiency. We may wonder that the technical man, while studying through a microscope of small details, is able to adjust his vision to the telescope of broader views, but such is possible, as is demonstrated by the success attending the administration of some of our largest works and enterprises. Three words may define the terms of success for the engineer of the day: Truth, System, Energy.

Truth is the basis for all technical investigations, for the elements of structural soundness, and for the development of practical results. From the elementary beginnings of the class-room to the intricate details of the finished work, we must follow the straight line of truth. In your own chosen profession of the mining engineer, the man who will examine the mine after the most thorough methods, conscientiously select and care for his samples from beginning to end, study plans for development with regard to every possible outcome, and report *the truth*, this is the engineer that will finally command respect and favor. Under the stress of competition, the desire may come to present mining prospects in a more favorable light than your honest investigation may permit. Better condemn a thousand properties at the expense of being called too conservative, than favor the expenditure of one penny through the recommendations of a highly colored report.

The true mining engineer will not offer a professional report on any property or process in which he has a personal or financial interest. When he leaves the limits of his profession and deals in shares of stock on which he may have private knowledge, he brings disgrace upon the profession, and he should suffer the penalty of being deprived of his degree. Do not bring discredit upon this splendid profession by dabbling in stocks. Modern business, in the effort to facilitate the exchange of goods, offers a commission to proper agents as a compensation for time and attention, and when conducted in accordance under recognized rules, this bonus serves as a stimulant to trade, but when the professional engineer, in addition to his salary or fee, expects a commission on the purchase or sale of property, plants, or processes, he dishonors his profession and disqualifies himself as a disinterested advisor. Associate yourselves with worthy enterprises, give an impulse to sound developments, proclaim all that is good, denounce fearlessly every bad feature, and do your share to raise the mining industry to high standards of honor and confidence.

Next comes system. The great power from knowledge of facts comes from their systematic classification in notes, or the ability to find the authority. At this moment your impression is that you will never forget the formula you now recite so promptly. The test will come in ten years from now, and fortunate is he who has written his notes for a correct translation. The memory training of the class-room is a fine accomplishment, but let me warn you, you must begin now the system of keeping legible and comprehensive notes, if you are to follow the amazing pace of technical changes.

Among the books acquired in my student days are volumes that are now obsolete; one of our professors stated to me a few weeks ago that he was to deliver that morning a lecture on a subject not known at the time our class attended his lectures. Keep always the textbooks you now have, for they will be most familiar to you, and you know their arrangement better than that of a new edition. Begin now to accumulate a library in your own line of work and keep thoroughly up-to-date in latest editions of standard works. Technical books are expensive and you will appreciate the value of partial payments when you are on the payroll.

It is absolutely necessary to be familiar with the technical periodicals of the age if you wish to be thoroughly

*Address delivered to the class graduating from the State School of Mines, Colorado.

posted on the latest developments in technical matters. A work may be ever so complete, but unfortunately many are out-of-date by the time the second edition is issued. The very things we wish to know in our daily practice are to be found usually in the weekly journal of our particular line of work, and the data are often furnished by the man on the ground, who gives us the screen-mesh, the wire-number, the revolutions of a pulley, or the strength of a solution; and here let me urge all who may have the opportunity, to give freely from the data obtained in your own work. The age of mysterious trade-secrets is fast disappearing and you may have the privilege of contributing some thought, some result that will make a better system or a better plant. The preparation of a paper often carries with it a deeper investigation of the subject and leaves you with a better grasp of the particular details.

Societies like the American Society of Mechanical Engineers, and the American Institute of Mining Engineers, publish transactions of great value and here is a rare opportunity for the graduate. Many of these societies allow the graduates of technical schools to assume the grade of junior member or associate, and it is wise to enroll as early as possible in order that you may obtain the use of these fine volumes. In them you get a record of the day's work from the specialist.

The various handbooks are excellent for reference and save much time in the search for bits of information. Trade catalogues often contain excellent data for practical service, as such information is collected and verified by the tests of a specialist. The increasing tendency to publish approximate dimensions and weights of machinery is to be commended, and in good time the manufacturer who offers such information will obtain the confidence of the engineering profession.

In your profession the keeping of notes is most important. For the field-notes, the mine-examinations, the records of chemical analysis, and like branches, there are certain well planned forms, but the vexing question is: "What form of notebook shall we use for the general practice?" After suffering the remorse of one who has seen the passing in review of various sizes of notes, from the folio to a vest-pocket edition, let me urge you to decide upon some standard size of notebook, which in years to come will look down upon you from your shelves in well-regulated ranks, instead of the motley forms of an awkward squad. Today the best form of note is found in the loose-leaf system, consisting of a leaf 4 by 7 inches, perforated and punched to allow filing in some permanent binder under its proper subject. Such a system includes the bound and perforated blanks to be obtained in dozen lots or more, the pocket case for holding a few leaves and miscellaneous data, and the binder. Please allow me at this point, to make a plea for some standard size of notebook for use in the work of *this* school. A conference between professors and instructors will accomplish much, and if not one size, then adopt a set of standard dimensions to be followed throughout the courses, thus providing the student with a convenient and symmetrical reference system. If during the first year there could be arranged a suitable course of instruction in the keeping of notes and data, the results to the practical engineer would be far more valuable than lofty flights in quarternions or methods of least squares.

The best system for library or office reference is the card-index, which may be used in various convenient forms; it admits of re-arrangement and is capable of being maintained up-to-date. This card-system serves well for indexing drawings, tabulations of accounts, cost reports, inventory of stock and, if well planned, becomes one of the most useful means of reference in an office. A habit to be earnestly commended is that of noting on index-cards, any important article or note, and filing it under a proper classification. When the technical magazine or book arrives, make it a practice to look over the articles carefully and write your card-reference for prompt filing; delay spoils the system.

Do not attempt any laborious or ornamental printing on these index-cards, for this requires too much time. Write in a legible hand, making such notations that you will understand them ten years from now. A valuable device for assisting in the work of office or field computations is found in the slide-rule. A surprising amount of time is saved in tabular or similar work, and it is a safe check on complicated estimates. The only way to master the instrument is to live with it day after day, and in time you will distance the man with the pencil and paper. Special computing scales are made with great refinement for rapid calculations of the most complex problems. Such advice may be a shock to your worthy professors, who have labored faithfully to instill into your minds the principles of certain mathematical equations, which in themselves are a necessary discipline, but the stress of the age requires the use of such expedients, and with their aid you will be saved many a weary hour.

In connection with your laboratory and field experiments you have found the value of section paper for plotting results. The diagram is also a useful means of displaying visually the variation in office accounts or the records of works. The daily output of the mine, the relation of wages or material to revenue, the ratio of non-productive to productive labor, all may be more clearly shown by a glance at the diagram than by hours of poring over tabular forms.

The best evidence that the engineer of the mine, smelter, or mill, employs system in his work, is in the form and manner in which he presents his requirements for machinery or material to the manufacturer or supply house. A poor sketch is better than none, and a list on a sample shingle may indicate your requirements, but the engineer who states *clearly* the problem he has to solve, and specifies in sufficient detail the list of material for the work in hand, is the one who inspires interest in the sales department. When the manufacturer receives a letter from a party requesting detailed estimates and specification for a 10, 20, 50, and 100-stamp mill, he sends the possible customer an estimate on a 10-stamp mill; and usually the incident is closed. When you ask for tenders on a smelter plant complete in all respects, with plans and specifications, do not forget to state whether the ore comes from Joplin or Jimtown. One of the puzzling questions to the manufacturer is the general tendency among works-superintendents to fail in keeping a sufficient supply of extra parts on hand, ready for the emergency. An extra crusher-jaw, or a spare roll-shell does not require a great expenditure and a few days delay in the mill's operation may mean thousands of dollars. We may derive wisdom from the old lady's proverb: "'Tis better to be ready and not go, than to go and not be ready."

To determine the cost of an operation or an installation, is not as simple as it may appear. One of the first tasks to which the constructing engineer should apply himself, is the determination of costs for the various departments of the organization. Fixed expenses, such as rent, insurance, taxes, salaries, also wages of non-producers, bear an important part in the success or failure of an undertaking, and require constant watching with an endless amount of planning.

In mining, smelting, or milling systems, the greatest revenues are derived by maintaining the plants or processes in successful operation day after day, and the great factors in producing these results are found in sound

materials and best possible designs in mill and machinery. Study the most successful plants of your mining country and you will find the best machinery that money can buy. The call is not how cheap, but how perfect. However simple the installation, build as well as you know how, use the best materials, adopt generous dimensions and the additional expense will soon be made up in long and continuous service.

Put your own soul into your work, insist on true and sound construction, whether above or below ground, and when your structure is complete it shall be said, as in 'The Building of the Ship':

> "We know what Master laid thy keel
> What Workmen wrought thy ribs of steel,
> Who made each mast, and sail, and rope,
> What anvils rang, what hammers beat,
> In what a forge and what a heat
> Were shaped the anchors of thy hope!"

The stress of the present day and the demand for higher efficiency mean energy of body and energy of mind. The way is full of hard pulls and there are no short cuts. To raise a ton of material through a vertical distance of 100 ft., requires just so many foot-pounds. Clever combinations of levers will not lessen the amount of work.

The graduate should realize that a superintendent or a manager is not made by the presentation of a degree. The man who possesses the patience to make his start in difficult details, taking all as they come, mastering each stage of the course and making himself skillful with head and hands, is the one who makes the goal. There is no experience in the career of the engineer like that derived from intimate knowledge of details in the days of his apprenticeship. The self-confidence developed by shaping things with one's own hands is the most important, and he who can do the work himself is best equipped for the direction of others. This practical man, knowing the correct use of tools and the best distribution of materials, develops the best qualities in his workmen and plans each move to count for something, and the final result makes for strength and harmony.

After three or four years of technical school investigations, the overalls and the dinner-pail play their part in the rounding of some of our acute angles. You will never forget your first experience with the mine-timber crew, and the Austrian slag-pot pusher will show you some tricks in applied mechanics. Often points suggested by these earnest workers may be the inspiration of a great development. When a workman has the interest to improve some detail in your plant, give him due credit, and you will gain his respect and loyalty.

With all the energy of purpose and practical application, will success then be accomplished through intense devotion to one special line of a profession? The true success includes not only the skill highly developed in one direction, but requires that building of personal character, that interest and responsibility in matters of citizenship, Church and State, that shall round our polygon nature to the circle, the symbol of a splendid manhood. In a word:

"Whatsoever things are true, whatsoever things are honest, whatsoever things are just, whatsoever things are pure, whatsoever things are lovely, whatsoever things are of good report, if there be any virtue and if there be any praise, think on these things."

AN interesting occurrence of monazite has been found in Queensland. It has been known for some time that monazite occurs sparingly in the beach sands on the coast of Queensland, and that probably the most promising deposits are near the mouths of the Tweed and Johnstone rivers. These deposits have not as yet been proved to contain this mineral in commercial quantities.

The Timber Supply.

Every person in the United States is using over six times as much wood as he would use if he were in Europe. The country as a whole consumes every year between three and four times more wood than all of the forests of the United States grow in the meantime. The average acre of forests lays up a store of only 10 cubic feet annually, whereas it ought to be laying up at least 30 cu. ft. in order to furnish the products taken out of it. Since 1880 more than 700,000,000,000 ft. of timber have been cut for lumber alone, including 80,000,000,000 ft. of coniferous timber in excess of the total coniferous stumpage estimate in 1880.

These are some of the remarkable statements made in Circular 97 of the Forest Service, which deals with the timber supply of the United States, and reviews the stumpage estimates made by all the important authorities. A study of the circular must lead directly to the conclusion that the rate at which forest products in the United States have been, and are being, consumed, is far too lavish, and that only one result can follow unless steps are promptly taken to prevent waste in use, and to increase the growth rate of every acre of forest in the United States. This result is a timber famine. This country is today in the same position with regard to forest resources as was Germany 150 years ago. During this period of 150 years such German States as Saxony and Prussia, particularly the latter, have applied a policy of Government control and regulation which has immensely increased the productivity of their forests. The same policy will achieve even better results in the United States, because we have the advantage of all the lessons that Europe has learned and paid for in the course of a century of theory and practice.

Lest it might be assumed that the rapid and gaining depletion of American forest resources is sufficiently accounted for by the increase of population, it is pointed out in the circular that the increase in population since 1880 is barely more than half the increase in lumber cut in the same period. Two areas supplying timber have already reached and passed their maximum production—the northeastern States in 1870, and the Lake States in in 1890. Today the Southern States, which cut yellow pine amounting to one-third the total annual lumber cut of the country, are undoubtedly near their maximum. The Pacific States will soon take the ascendancy. The State of Washington within a few years has come to the front and now ranks first of all individual States in volume of cut. At present but one-fifth of the total forest area of the United States is embraced in National Forests. The remaining four-fifths have already passed or are most likely to pass into private hands. The average age of the trees felled for lumber this year is not less than 150 years. In other words, if he is to secure a second crop of trees of the same size, the lumberman or private forest owner must wait, say, at least one hundred years for the second crop to grow. As a rule, such long-time investments as this waiting would involve do not commend themselves to business men who are accustomed to quick returns. But the States and the Nation can look much farther ahead. The larger, then, the area of National and State control over woodlands, the greater is the likelihood that the forests of the country will be kept permanently productive.

OWING to the demand for ferromanganese and spiegeleisen, the requirements of the steel manufacturers in the ores that are used to produce these metals has been slightly modified, particularly in the reduction of the phosphorus minimum.

A Visit to Ely, Nevada.

Written for the MINING AND SCIENTIFIC PRESS
By JAMES W. ABBOTT.

Anyone approaching Ely from the west leaves the Southern Pacific train at Cobre, 405 miles east of Reno and 137 miles west of Ogden. Just two miles west of Cobre the train passes a siding where today not even a freight is scheduled to stop. About this siding, if one looks closely, may be seen some ruins of the old town of Toano, famous in the days of Nevada's primary period of production. Then the Central Pacific was the only railroad to the Coast and Toano served as the shipping point for the rich camps in White Pine and Lincoln counties. The regular rate for freighting supplies to Pioche, 250 miles to the south, was six cents per pound, and in similar proportion to other camps according to distance, while by Pritchard's 'fast freight' the rates were much higher. This express service had regular stations, where the mules were changed, so that the wheels were kept rolling day and night.

Excavating for Foundations of Concentrator.

Until recently the belated traveler, compelled by mischance to spend the night at Cobre, obtained atrocious meals, a cot in a tent corral, and no adequate protection against a climate often bitterly cold. The rapid march of progress throughout this entire region has already bettered conditions in many ways. Now even the limited trains actually stop at Cobre, where a comfortable hotel, managed by refined people, furnishes wholesome food and suitable beds. Daily standard pullman cars run through each way between Ely and Salt Lake City, and new equipment to be immediately installed on the Northern will further ameliorate travel to the Nevada mines.

This railroad from Cobre to Ely (141 miles) runs through the Steptoe valley, an old lake-bed, level as a floor and nowhere less than five miles wide. Throughout this entire distance the rise in elevation, approximately uniform, averages less than three feet to the mile, and there is neither cut nor fill, culvert nor bridge, more pretentious than one finds on the ordinary country highway. When the roadbed becomes thoroughly settled and is properly ballasted, the railroad conditions will resemble those in the Mohawk valley on the New York Central.

The Site of the Big Smelter at McGills, April 1, 1907.

The first station on the road to Ely, 20 miles from Cobre, is Bews, the place where Gould's Western Pacific line to the Coast will cross the Nevada Northern. From Bews to Salt Lake by the Western Pacific is about 160 miles, practically 35 miles less than it is by the Southern

Pacific. Bews, yet a tent city, is today the centre of great activity. The Western Pacific, already operating its construction trains 85 miles out from Salt Lake, hopes to reach Bews about next Fourth of July, when daily Pullman service to Ely will be established by that line also. Three different routes for a branch road to Ely have been surveyed, and as soon as one of these has been selected, grading is to begin. The Clark road (San Pedro, Los Angeles & Salt Lake) will without doubt extend its Pioche branch (now under construction from Caliente) to Ely, while two lines are already projected west from Ely to Tonopah, one of which is sure to be built in the immediate future. Ely then, with its own Pullman service to San Francisco, Los Angeles, and Salt Lake by the Santa Fe, Southern Pacific, Western Pacific, and Clark systems, may be expected to confidently challenge any other mining camp on earth (not in Nevada) to rival her facilities for transportation.

When the Nevada Northern was first built, inflated by the opportunity presented to make money, the railroad company began to levy toll in a fashion that Ely much despised. The old Southern Pacific theory, so vividly remembered in California, of levying "all the traffic would bear," was here exemplified in 10 cents per mile for passenger fares and the former wagon-rates for freight. But a new management, with clearer perspective (perhaps influenced by the Nevada State Railroad Commission), has seen a great light, and definite promise of immediate relief to come has made the heart of Ely very glad. Present rates on brick and cement from Salt Lake to Ely are, respectively, $12.80 and $9.60 per ton. On April 17 the rate on brick dropped to $8 per ton, and on May 13 cement went to $5.60. The lumber rate today is nearly $20 per thousand feet, but it is confidently expected that this will be decreased at least one-third, while even a four-cent passenger rate is expected by the optimists.

Eighty miles from Cobre the railroad passes through Cherry Creek, a high-grade silver camp, where they are now reviving memories of White Pine days. One hundred and twenty-eight miles from Cobre, with Ely yet 13 miles away, the train stops at a water-tank, just on the border of a region where history is being made rapidly. On the gentle slope of the foothill three miles to the east, is arising what is to be one of the world's notable industrial cities. It is known as McGill's, named after old Billy McGill, who located a ranch here early in Nevada's primary period and for 35 years raised potatoes, hay, and a family. Billy McGill believed in the country and he kept gathering unto his ranch contiguous acres until his faith reached fruition a year or so ago when he sold his holdings to the Steptoe Valley Mining & Smelting Co. for $90,000.

The interests at the head of the American Smelting & Refining Co. entered the Ely district about two years ago and secured the properties now grouped into two corporate managements, known as the Nevada Consolidated and Cumberland-Ely companies. They built and own the Nevada Northern railroad, and control the company that is erecting the vast reduction plant at McGill's to treat their own product, present and prospective, as well as custom ore. The Nevada Northern is planning to drop a network over the hills behind Ely. Over these will come the cars laden with ore. When this ore drops into the bins it will probably contain an average of less than 2½% copper. It will leave McGill's ready for the refinery.

The plant of the Steptoe Valley Mining & Smelting Co. is to be 6,000 ft. long and will have separate concentrating, leaching, and smelting departments. The concentrating department is planned to have 10 sections, each with a capacity of 1,300 tons daily of crude ore, to be concentrated in the ratio of seven into one. Three of these sections, or units, are to be completed immediately and installed with the least possible delay. Two 3-yard bucket Bucyrus steam-shovels are now at work day and night excavating for the foundations, and their labor is being supplemented by six 4-horse scrapers, two 2-horse ditto, a 6-horse plow, and a 2-horse stone-boat, all delivering dirt on top of the bank above the shovels.

Should the concentrator get into service ahead of the smelter, its product will be shipped temporarily to Garfield, near Salt Lake City.

It is the purpose to start the smelter plant with 16 McDougal roasters, each with a daily capacity of 40 to 50 tons of concentrate; three 111 by 19-ft. reverberatories, each with a daily capacity of 250-300 tons; a blast-furnace for smelter-slags and odds and ends; and three 15-ton converters. The stack, to be the largest ever constructed, will be 550 ft. high, with an inside diameter of 23 ft. at the top. The main flue leading to it will be 1,400 ft. long, with branches from the roasters and reverberatories. A power-house, 320 by 135 ft., to generate at first 8,000 h.p., is to be built at once. The grading for roasters, reverberatories, and power-house is already practically done. The hillside has a slope of about 10%, thus lending itself readily to the plans for automatic handling of products in the successive processes of treatment. The company has purchased the right to the water of Duck creek, on the eastern slope of the hill. The plan will probably be to bring this water through the hill in a 2,600-ft. tunnel and with it to generate 10,000 h.p. Springs on the old ranch also furnish the water now being utilized for immediate needs.

Ely, like Gaul, was once divided into three parts. Ely proper was the old Robinson camp, in the days when the Eberhardt mine at Hamilton, 50 miles west, was turning the heads of millions of people and making the name of White Pine as well known throughout the world as Pioche and Virginia City. At the zenith of its frenzy the three camps of Hamilton, Shermanville, and Treasure Hill, which together constituted White Pine, had a population of 30,000 and the streets at times were filled with a dense mass of humanity, making traffic well-nigh impossible. As in all mining excitements, the restless tides ebbed and flowed. Distance lends enchantment. The search for the Golden Fleece lures men from camp to camp, and the prospector is the typical Wandering Jew. Pioche was ever a magnet, drawing recruits from White Pine, and the gold of Robinson Camp furnished diversion by the way. So the stream from White Pine to Pioche helped to swell the camp at Robinson, and many tarried there to prospect.

It was the lure of gold that brought the pioneers to these camps of the West, now famous for copper, and in this respect Robinson had a history akin to that of Butte, Iron Mountain, and Bingham. Here also the gold played out and the detested copper came in and for years gloom and despondency attended the transformation.

Some time before the new day had dawned for the old camp its name had been changed to Ely. Then came the real estate boom. Bordering Ely to the north, Steptoe valley widens out into a regular flat with alluring opportunities for corner lots, the play of fancy and the temptation to glowing rhetoric and other things. They call it Ely City. Up the cañon of Robinson creek, two miles nearer to the mines, the gulch widens to a flat with a good many acres suitable for building. The real estate man has attached to this evidence of God's bounty the name Lane City, and a goodly hoard of dollars has been gathered from lots here sold at city prices. So the three parts into which Ely is divided really form one commun-

ity which, to the world outside, means just Ely. Lane City will always be in demand for miners' homes, because nearer to their daily work. Whether the commercial supremacy will remain with the old town or be shifted to its rival will depend upon conditions yet to develop.

What the future of mining in that belt shall be must depend also upon conditions not yet clear. Enough is already known to suggest the splendid future of Ely. Two properties of the Nevada Consolidated, the Copper Flat and the Ruth, have been examined separately by three different mining engineers, of high repute and wide experience. One of these reported 16,000,000 tons of commercial ore in the Copper Flat and 6,000,000 in the Ruth, averaging about 2.3% and which should yield a profit with 10c. copper. Another reported 12,000,000 and 10,000,000, respectively. The exact figures of the third report have not been given out, but it is known that he confessed to finding over 20,000,000 tons in the two properties.

No one believes for a minute that either of them reported all he saw. For seven miles in length and in places over a mile in width, copper ore has been found along the belt. Besides the Copper Flat and the Ruth, the Cumberland-Ely, Chainman Group, Giroux Consolidated, Turner-Ely, Ely Central, Ely-Witch, Ely Mines Co., Boston-Ely, Ely Consolidated Copper, Federal-Ely, McDonald-Ely, and the Ely-Revenue are all known to be in ore, but how much they have is not known. The Giroux Consolidated has recently been examined by engineers representing those in control of the Nevada Consolidated and the Cumberland-Ely properties. The report has not been made public, but the salient facts are that in the Alpha shaft, at 1,000 ft., there have been found bodies of ore 50 ft. wide that assay 20% copper, still oxidized, so that there is probability of finding even large masses of concentrating ore below the zone of oxidation.

When nature starts in to mineralize a whole body of porphyry and make ore out of it, there is a good deal doing and it is not easy to draw the line.

GOLD MOVEMENTS into the United States in the fiscal year which ends with this month will exceed those of any earlier year, and the excess of imports over exports of this metal will also probably be greater than in any earlier fiscal or calendar year. The 10 months' figures of the Bureau of Statistics of the Department of Commerce and Labor now available show gold importations amounting to $109,616,707 and gold exportations of but $23,003,407, making the excess of imports over exports in the 10 months $86,613,300; while for the 12 months ending with April the imports of gold are $146,896,815, and the exports are $31,981,947, making the excess of imports over exports for that period $114,914,868. The largest importations of gold ever occurring in any fiscal year were $120,391,671 in 1898 and $100,031,259 in 1881, while in no other fiscal year has the total of gold imports ever crossed the 100-million-dollar line. A comparison of these figures of excess of imports over exports with those of previous years indicates that unless a marked change shall occur during the next two months in the general movements of gold into and out of the United States, the net imports for the full fiscal year about to end will be larger than ever before. The only fiscal year in which the net imports of gold, or excess of imports over exports, exceeded 100 millions was 1898, when the figure of net imports was $104,985,283. The nearest approach to the 100-million-dollar line on any other occasion was in 1881, when the net importation of gold was $97,466,127.

The Prospector.

Enquiries sent to this department are answered free of charge, if submitted by subscribers who are not in arrears. The full name and post-office address of the sender must be given, otherwise no answer will be made. Those who are not subscribers must accompany their questions with a fee of $3 for each question. No assays are made.

Two specimens of Andesite were sent by T. P. B., of Alamos, Mexico.

G. H. H. sends a specimen of Kaolinite from Sulphur Springs, Colorado.

A specimen of black Quartzite was sent by P. G. from Naranjera, Mexico.

The brown mineral sent by J. W. O., of Piute, Cal., is an Andradite Garnet.

Specimens sent from Mill Valley, Cal., by W. B. H., have not been received.

A specimen of the arsenic ore, Realgar, was sent by D. F. O., from Manhattan, Nevada.

The two specimens which were sent from Denver by S. W. and which were supposed to contain Tungsten are Magnetite in a Pegmatite Granite.

The Kaolinite from Yerington, Nev., sent by C. B. C., appears to be of good quality. Some Western firms using clay are: Corona Press Brick & Terra Cotta Co., Corona, Cal.; Douglas Clay Product Co., Los Angeles, Cal.; St. Louis Fire Brick & Clay Co., Los Angeles, California.

The rocks sent from Nogales, Ariz., by E. E. N., are: No. 1, Quartzite; No. 2, Quartz; No. 3, Andesite; No. 4, altered Andesite; No. 5, Dacite; No. 6, Rhyolite Tuff; No. 7, Rhyolite Porphyry; No. 8, Andesite; No. 9, Dacite; No. 10, Dacite; No. 11, Andesite; No. 12, Andesite; No. 13, impure Limestone; No. 14, Rhyolite; No. 15, Rhyolite.

SILVER MOVEMENTS into and out of the country seem likely to show a smaller excess of exports over imports in the fiscal year about to end than on any occasion during the past decade. Movements of silver into and out of the United States are in each case large, the inflow coming chiefly from Mexico. This large movement of silver into the United States, already a great silver-producing country, is due largely to the fact that her facilities for smelting and refining are more satisfactory than those of her silver-producing neighbor, Mexico, and that Mexican silver moves to the smelting and refining establishments of the United States, a part of it coming in lead ore and a part of it in the form of base bullion. The largest imports of silver in any full fiscal year were those of 1906—$41,442,540—and those of the present fiscal year seem likely to be about the same. The largest exports of silver in any fiscal year occurred also in 1906—$65,869,063—while the total for the present fiscal year seems likely to fall considerably below that of last year. The excess of exports of silver over imports of that metal amounted in 1906 to $21,426,523, and has been continuously above the 20-million-dollar line (and in some cases above 30 millions) since 1893, but the present indications are that the excess of exports over imports will, in 1907, be far below that of any other year in the period just named. For the 10 months ending with April, 1907, the excess of exports of silver over imports of that metal was $11,191,235, and for the 12 months ending with April, $13,086,196, against $21,126,523 in the fiscal year 1906.

Silver-Lead Smelting Practice.—IV.

Written for the MINING AND SCIENTIFIC PRESS
By T. S. AUSTIN.

LOSS OF GOLD IN REFINING BASE-BULLION.—[In a letter written in 1887, referring to gold losses in refining, he says:] There is a tendency to favor a higher result when the amount of gold is small. This may come from using dilute acid, from imperfect washing, and sometimes from errors in weighing. Of course, in a large works care should be taken to work up everything that contains gold or is liable to contain it, that is, the gold alloy, the drosses of every kind, the blue powder. It is more likely that the loss comes in the assaying, or possibly in the sampling, or both. There is also one more direction to watch and guard against loss, namely, in the silver bars. Is all the gold taken out in the first zincking, that is, the gold-skim zincking? You know how we always tested for gold after this zincking, and not infrequently found it. If bullion is not clean when it comes from the softener, this slip may happen, and you know that in some works they add a certain amount of zinc no matter what the charge is. In the old days at the Germania, when we did not zinc for gold, but took it and the silver out together, there was no loss of gold. It was in later years when there were two first zinckings, that is, gold and silver, that the gold-losses appeared, though they were never great.

SILVER-LEAD SMELTING WITH CHEAP LEAD ORES.—[Referring to conditions where there was plenty of lead ore to be smelted, and where, in consequence, some might be wasted in the slag, he says:] It costs more to keep the slag at 1% than higher; by getting a correct composition you will do good work in your running of the furnace, as well as metallurgically. If you had a fair amount of coke and a pretty good charcoal you could run a three-quarter slag (33% SiO_2, 34% FeO, and 23% CaO) and could do good work. This would be about as much lime as you would care to run. With enough fuel you could get a slag of 0.5 to 1.0% lead, and (with low-grade bullion) practically free of silver. Remember that though lime is a good cleaner, it takes considerable heat to melt it. My experience has been, however, that a three-quarter slag requires but little more fuel than a half-slag.

CONDITIONS OF SMELTING INDUSTRY IN 1894.—I think very poorly of the smelting business just at present. The big plants at the smelting centres can, and will, control the entire thing, and I have about made up my mind to pay no further attention to smelting for the present. Of course I can see that improved methods will, or would, make a great difference financially; but these methods are already in the hands of the large central works and enable them to crush out the small plants that have not got the railroad and other facilities.

MECHANICAL FEEDING OF SILVER BLAST-FURNACES.—[In 1894, referring to the mechanical feeding at Pueblo, he says:] It is a very good way, where you are rigged for it, and it effects a considerable saving in labor. Still I cannot get away from the notion that it is necessary to see and control your feeding. On the other hand, our labor here (in Mexico) is unreliable, and it might be that such a mechanical device as you describe would be more certain and regular than our hand-feeding. For are not the irregularities that we have to remedy by special feeding caused by the negligence of the men themselves (especially in the small hours of the morning)?

MATTE CONCENTRATION.—There is but one way to concentrate leady copper-matte, namely, by blast-furnace smelting. I use a solid hearth and tap the lead, matte, and slag into a settler, from which I run the slag and matte into an ordinary pot. These pots are set out to cool, and the matte broken off. Lead is emptied or tapped periodically from the settler.

I find it best to have high reduction, and get all the lead possible out of the copper matte. It saves lead, both in the slag and in the matte, and there is no objection to it as far as the furnace-working is concerned.

MATTE AND SLAG SEPARATION.—It strikes me that the mode of handling and fussing with their slag at the Grant smelter (Denver) is not very rational. It seems like a mussy performance, and not so good as the forehearths or settlers. Unfortunately, settlers are not always sure in their separation, and require frequent changing. They also require very nice settling and a good slag. In removing slag, small pots seem rather barbarous and primitive, especially in connection with big dumps.

THE SLAG SEPARATING FURNACE AT EL PASO.—I have just got my separator repaired and in shape, and am ready for another year's campaign with it. It did not freeze up, but the fire-box lining was about consumed. It certainly works very well now that it has been overhauled, and takes the silver pretty well out of the slag. We ran ten days with overflow pots, and did good old-fashioned work, but our slag-shells were about double in silver to what they would have shown on the separator, *ceteris paribus*. At Monterey, where the separating furnace is employed, they have to be careful what type of slag they use. The zinc in the slag is almost at a point where it is liable to settle out in the separator, and make a troublesome crust. They wish to make a lime slag for commercial reasons, and were afraid that it would not work in the separator. However, their experience and my observation convinced me that such fears were groundless, and that a properly devised three-quarter slag would be clean and give good separation. It seems that when using a one-to-one slag a crust was formed in the furnace. It was only brought into shape again by the use of a two-fifths slag. After this trial it was run on a three-quarter slag until an exact one-to-one slag was tried on it for two days, but, as a zinc crust again showed up, we dropped back to the modified three-quarter slag; the separator immediately came into good condition, and was in that condition when I left. I may say that under the present conditions of ore supply, the separator will be eminently successful, if run on a proper slag of between the limits three-quarter to seven-eighths lime-iron ratio, with silica not too high.

CRUCIBLE DROSSES.—Dross may come from bad reduction, or, it may be due to the presence of copper accompanied by over-reduction, or again, with copper, to the lack of sulphur to take up that metal in matte. With much dross in the crucible one may notice that the slag is not exactly correct, and, at any rate, pretty high in lead, with the furnace working irregularly above, that is, with over-fire, hot-top, and blowing through violently.

TREATMENT OF SPEISS.—The formation of speiss upon the surface of the lead in the crucible is almost unavoidable, and especially when running a slag high in iron (as a quarter-slag) and when, with much arsenic present, the slag becomes incorrect. Roasting would be the natural method to follow; otherwise there is a loss of silver and lead in the speiss and matte and bad working

*These observations of T. S. Austin, recently deceased, general superintendent of the Southern Department of the American Smelting & Refining Co., are compiled from letters written by him to his brother, from 1883 to 1906, covering most of the period of his wide experience in silver-lead smelting, and to some extent that in base-bullion refining. They lack some of his recent experiences, but show that much of his knowledge had been brought into finished form some time before his death. The notes refer largely to his work at Socorro, New Mexico, Monterey and Chihuahua, Mexico, and to El Paso, Texas, together with other technical observations made during that time. Professor L. S. Austin's remarks are in brackets. The first of this series appeared in our issues of February 23, March 16, and April 27.

of the furnace, which will make the smelting of such stuff run both expensive and difficult. The point is that where arsenic makes speiss upon the charge, it needs the more silicious and lime slags to keep it liquid and to carry it out of the furnace. The irony slags are inefficient in affecting this. If containing copper, it is hard to desilverize it. It might perhaps be done by putting it through a blast-furnace with refining-skimmings together with some sulphide ore, the copper going into the matte and the arsenic being, in part, volatilized, and at any rate desilverized, the furnaces being run with poor reduction. However, no great percentage could be put through for fear of trouble at the tuyeres and at the crucible. Speiss, when ground finely and roasted with pyrites, would be so improved as to give no further trouble at the blast-furnace.

The Legal Work of a Mining and Reduction Company.

When the legal business of an incorporated and fully equipped mining company justifies it, the services of a law firm may be secured for these duties, and when it has a large amount of property to take care of, a special department insures the systematic transaction and economical management of its legal business. Above all, the rights of the company must be defended in their patented claims, which, under the United States law of the apex, are liable to be brought into litigation. In the first place, every legal precaution should be given to making the patent of the property clear; and in those cases where it may happen to be defective, it will need to be skillfully defended—the loss of such rights involving the very existence of the company. In those States where, under the common law, the property is included within the vertical planes of its borders, these difficulties are largely eliminated. One has to but recall the litigation between Heinze and the Amalgamated to realize the importance of legal effort.

The corporate management of a large company is particularly under legal observation. By incorporation it is possible to unite the resources of many for a common purpose, to avoid the embarrassment due to the death of one of its members, and to limit the liability of any member. A charter of incorporation can be obtained under the laws of any State and a lawyer is properly employed to do this. The charter having been obtained, by-laws must be framed for conducting the corporation business of the company, to provide for its meetings, officers, and management. The preparation of the by-laws and the amending of them from time to time is legal work. There is also the preparation of motions, the drafting of resolutions to be adopted at meetings of the stockholders and directors of the company, and the preparation of minutes of corporate meetings. Nearly all corporate action takes the form of written resolutions, and such resolutions have to be prepared with great care. In case of the consolidation of different mining corporations into one, or the purchase of property from another, the minutes of the meetings of the corporations involved are frequently elaborate, and must be carefully framed in accord with the several statutes covering the transaction. There is also the preparation of the contracts of the company when it rents land or houses. Leases must be prepared to protect the right of both lessor and lessee.

The preparation of mortgages, where bonds are to be issued, calls for the greatest care. The financing of the company may depend upon these instruments, and elaborate provision must be inserted therein, in order to tempt capitalists to invest in the bonds, and to provide for them the security to which they are entitled. Contracts for construction may involve large sums, and careful specifications and provisions are needed to prevent litigation. Also, where land or property is bought, deeds must be drawn. If, for any reason, it is undesirable to commit the company to the purchase of a mine or other property, or if time is necessary to examine properties with respect to their value and title, options must be drafted, giving the privilege of acquiring the property if desired. Contracts must often be made for the purchase of fuel, fluxes, timber, or other supplies.

Turning to the subject of litigation, damage suits for accidents are unavoidable, some involving fictitious, exaggerated, or real injuries. Where the company is operating smelting furnaces, which yield noxious gases, damages to land or stock may be claimed on this account also. Companies receive and dispatch a large amount of ore, products and supplies by rail, and since railroads insure the freight, they are called upon to pay claims for damages, where accidents, and especially fires, give rise to such claims. The injury or delay of materials in transit may also be productive of claims of the company against the railroad; such claims, when they cannot be adjusted peaceably, ultimately give rise to suits, but even before suit is brought, legal advice is necessary in the process of adjustment. The company may be harrassed by garnishment of the wages of its employees and the danger of double payment must be guarded against. The arrest of wrong-doers has to be made under legal advice, as upon failure of any criminal proceeding, a suit against the company for malicious prosecution may be expected.

The relation of the company to the State calls for legal services. Sometimes it may be to defeat hostile legislation in the Congress, or in the Legislature. The subject of taxation is always involving some controversy, and may give rise to litigation.

If anyone is injured or killed it is the business of the lawyer to reach the spot promptly and endeavor to settle claims without delay. Even a small delay involves having to pay the claimant's lawyer as well as himself. The statements of witnesses are to be taken down in writing, both for enlisting the witness on behalf of the company, and for recording the facts before they are forgotten. The importance of such work is seldom appreciated, but as a rough estimate, it is about three times as expensive to dispose of a claim by litigation as by amicable settlement. The effort to settle should be continuous, instead of being dropped until suit is brought. It is false economy not to have this strictly looked after. In conclusion it may be remarked that, just as in medicine it is cheaper and more effective to prevent than to cure disease, so in the conduct of the affairs of a mining company it is better to consult the lawyer before than afterward.

THE coarser and cheaper forms of asphaltic substances are used extensively in the manufacture of roofing and paving materials and for waterproof paint on wood, iron, and stone work. The demands of the Eastern markets are supplied for the most part from Trinidad, Venezuela, and Sicily, but the California oil-asphaltum has been used to some extent for street pavements and other purposes in New York and other Eastern cities. Gilsonite, or uintahite, is a very pure form of hard asphaltum, which is separated and sold in two grades. The best grade is used for making varnish for ironwork and for baking japans, and similar purposes. Second-grade gilsonite is used as a cement in making pavements. Wurtzilite is similar to gilsonite in appearance and occurrence. It is refined and used for marine and iron paints and insulation, and as a substitute for rubber in certain compounds.

The Amalie District of California.

Written for the MINING AND SCIENTIFIC PRESS
By L. H. DYKE.

This district is in the central part of Kern county. Amalie, the oldest settlement in the district, is 40 miles east of Bakersfield and 12 miles from Caliente, the nearest railroad point. A daily stage runs from Caliente through Amalie to Piute. There is also a daily stage from Caliente, through Havilah and Vaughn, to Kernville.

During the last year there has been some activity in mining in this district. In July, the Gold Peak Mining Co. began operating its new plant, which is situated in the Caliente cañon, 12 miles from Caliente. The plant consists of a 10-stamp mill, five Frue vanners, and a cyanide plant of six vats for treating sand and two vats for the treatment of slime. The power is furnished by two gas-engines, one being used to run the rock-breaker, stamps, and vanners; while the other runs the pumps, the dynamo for the electric lighting, and the small machinery, such as the sample-crusher and pulverizer and the zinc-shaving machine. The present workings of the mine are half a mile from the mill and 300 ft. above it. The ore is conveyed from the mine to the mill by an aerial tramway operated by gravity. A large and well appointed assay-office completes the equipment.

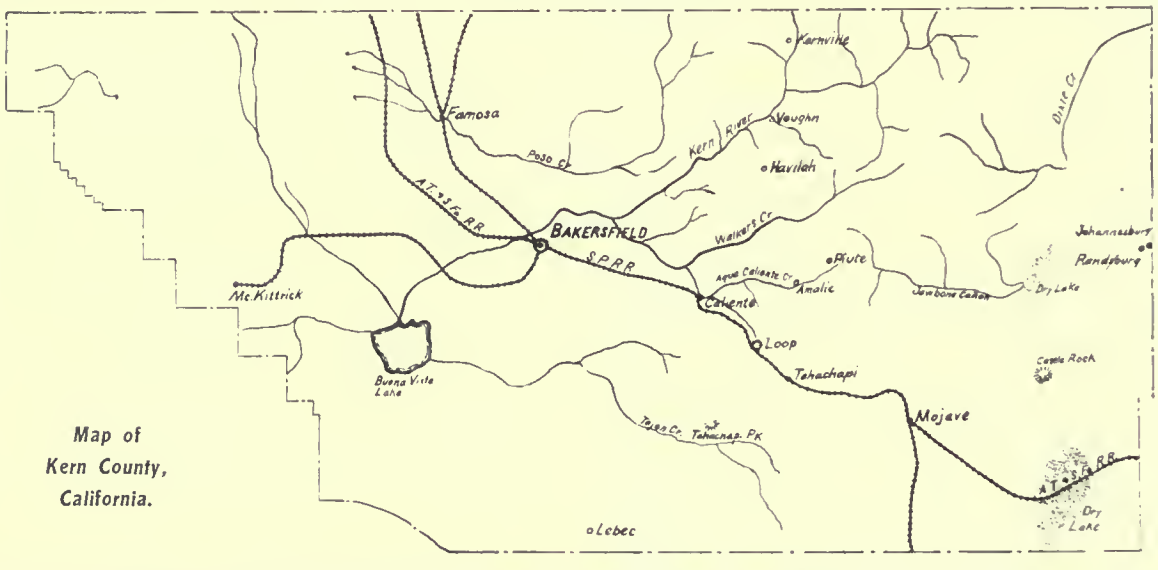
The plant of the Zenda Mining & Milling Co. is situated 10 miles from Caliente and consisted originally of a 10-stamp mill and a cyanide plant. Last summer, however, the cyanide annex was discarded and a pan-amalgamation plant was installed. As now equipped the plant consists of a 10-stamp mill, three Standard concentrators, four 5-ft. pans, and two 9-ft. settlers. The power is furnished by a 75-h.p. steam-engine. The company also maintains a small, but fairly well equipped, assay-office. The Zenda mine is three-fourths of a mile from the mill and 500 ft. above it. An aerial tramway operated by gravity has been built to convey the ore from the mine to the mill. Since the installation of the pan-amalgamation process the mill has been treating second-class ore from the dump of the Cowboy mine, situated about two miles from the mill. After doing this custom work, the Zenda mill was shut down in order to make repairs and improvements. Both the Zenda and Cowboy companies are now engaged in developing their properties.

The Amalie mine, about two miles north of Amalie, is the oldest mine in the district. It has been in litigation for several years, but the difficulties have recently been adjusted and the plant is being repaired preparatory to pumping out the mine and resuming mining. The Amalie is the only mine that has been worked below water-level.

The ore is low-grade. The relative value of the gold and silver is in the ratio of one to four. The principal silver minerals are cerargyrite and argentite. Some pronstite is also found. The district is highly mineralized,

The Zenda Mill.

and there are several prospects that appear promising. But the development work and mining have been carried on in such a desultory manner as to fail to reveal what may be in the mines.



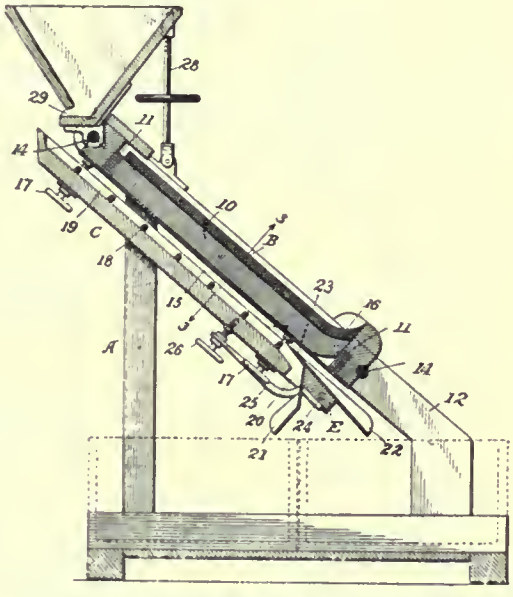
Map of Kern County, California.

BARON MUNCHAUSEN.—The author of this book was Rudolph Eric Raupe, who posed as a mining engineer and victimized people by his reports. He was the author of numerous scientific works, including an account of some German volcanoes in 1776; he translated the works of Ignaz von Born and J. J. Ferber. Born in 1737, he was educated at Gottingen, and became curator of the collection of coins at Cassel, where he appropriated 2,000 dollars' worth of medals. He was hunted over Germany, being captured at Clausthal, when he escaped to England, and was for some years storekeeper and assayer at Dolcoath mine in Cornwall. There he wrote 'Baron Munchausen.' Subsequently he was mixed up in some unsatisfactory prospecting in Scotland, and victimized a Highland proprietor. The incident furnished the material for Sir Walter Scott's Dousterswivel in 'The Antiquary.' He died in 1794, having sought refuge in the north of Ireland.

MINING AND METALLURGICAL PATENTS.

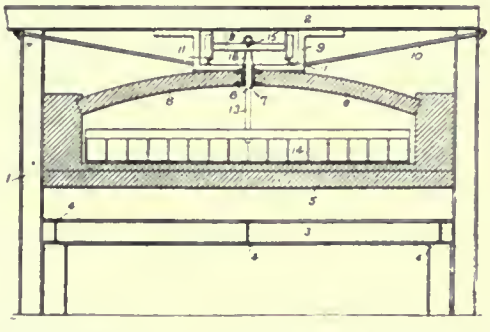
Specially Reported for the MINING AND SCIENTIFIC PRESS.

MAGNETIC ORE-SEPARATOR.—No. 855,166; Edgar A. Edwards, Cincinnati, Ohio, assignor to Alice V. Edwards, Cincinnati, Ohio.



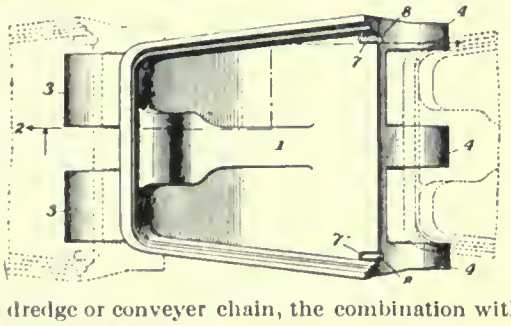
In an electro-magnetic separator, the combination with an inclined magnetic element the under surface of which co-operates with the material under treatment, of a circuit therefor, a source of energy adapted to produce in said circuit an alternating current having periods of rest between successive alternations, and means for feeding stock beneath said element.

ORE-ROASTING FURNACE.—No. 854,766; William H. Smyth, Berkeley, California.



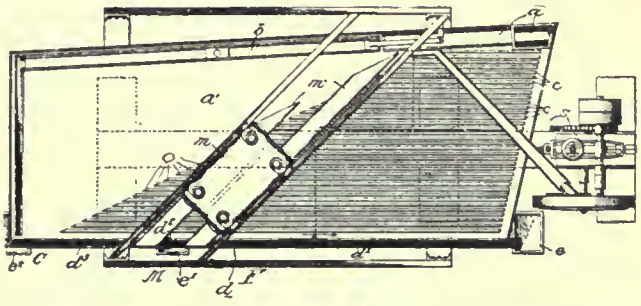
In an ore-roasting furnace, an arched roof provided with a slot the full length thereof intermediate of its sides and means adapted to support the arch; the roof is longitudinally slotted intermediate of its sides, rabbles or stirrers in the furnace and longitudinally traveling means, supported upon tracks, to which the rabbles or stirrers are attached, said means passing through the slot.

DREDGE-BUCKET JOINT.—No. 854,731; Alexander T. Fraser, Butte, Montana.



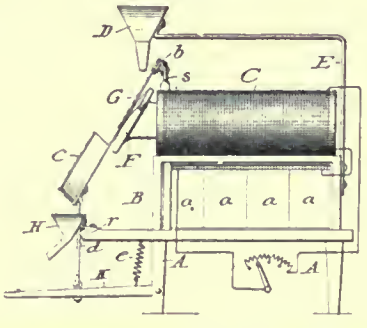
In a dredge or conveyer chain, the combination with the links having lugs and with the pivot pins, of bushings for certain of said lugs, each bushing comprising two relatively movable reversely tapered parts adapted, when assembled, to securely hold the bushing in the eye of the lug.

SHAKING-TABLE SEPARATOR.—No. 854,768; Frederick T. Snyder, Chicago, Ill., assignor to the International Separator Company, Chicago, Ill., a Corporation of New Jersey.



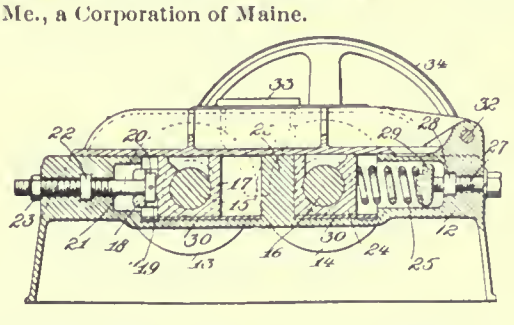
In a concentrator, the combination with a transversely inclined shaking table having longitudinal channels thereon, of means for feeding a mixture of magnetic and non-magnetic minerals and gangue to the head of the table, means for imparting a differential reciprocating motion to the table parallel to said channels in a direction to cause a travel of the mixture toward the foot of the table, means for flowing water across the table transversely to said channels to remove the gangue from the mixture, and a magnet suspended above the table near the foot thereof and adapted to exert a lifting force upon the magnetic constituents of the mineral concentrate, sufficient to cause said constituents to be washed by the water across said channels into a path divergent from the remainder of said concentrate.

APPARATUS FOR SEPARATING GOLD FROM MAGNETIC SANDS.—No. 854,997; Elmer Gates, Chevy Chase, Md., assignor, by mesne assignments, to Washington Loan & Trust Company, a Corporation.



Apparatus for separating gold from magnetic sand, comprising a magnet producing a non-uniform field, an inclined screen or apron extending within the magnetic field and upon which the material is fed, and means for imparting a succession of rapid but slight vibrations to the screen or apron, whereby the magnetic sand is arrested upon the screen.

ROLL CRUSHING MACHINE.—No. 855,358; Thomas L. Sturtevant, Quincy, and Thomas J. Sturtevant, Wellesley, Mass., assignors to Sturtevant Mill Company, Portland, Me., a Corporation of Maine.



In a roll crushing machine, the combination with a machine frame having open topped recesses, of a crushing roll rigidly mounted on said machine frame, a second crushing roll, bearing boxes for said second crushing roll yieldingly mounted for sliding movement in said recesses, and a cover over said rolls and extending over the tops of said recesses, said cover thus providing upper guideways for said yielding bearing boxes.

Books Received.

FIRE ASSAYING, by Evans W. Buskett. Published by the D. Van Nostrand Co., New York City. Price, $1.25 net.

THE DESIGN OF WALLS, BINS, AND GRAIN ELEVATORS, by Milo S. Ketchum. A 388-page book, well illustrated, and with many working drawings, dealing with retaining walls, masonry, and reinforced concrete, ore and grain-bins, and large grain elevators. The Engineering News Publishing Co., New York. Price, $4 net.

MINE TIMBERING. By Wilbur E. Sanders, Bernard MacDonald, Norman W. Parlee, and others. This is a reprint of articles that have appeared during the last five years in *The Engineering & Mining Journal*, the *Proceedings* of the Canadian Mining Institute, and those of the Canadian Society of Civil Engineers. In default of a systematic treatise on the subject, this compendium will be of service to mining engineers and superintendents, as well as to students. The book is well printed and adequately illustrated with excellent drawings. It is issued by the Hill Publishing Co., and is for sale by the MINING AND SCIENTIFIC PRESS. Price, $2.

Publications Received.

ZINC AND LEAD DEPOSITS OF THE UPPER MISSISSIPPI VALLEY, by H. Foster Bain. Bulletin No. 294. U. S. Geological Survey.

THE PROGRESS OF THE MINERAL INDUSTRY OF TASMANIA for the quarter ending December 31, 1906. Compiled by W. H. Twelvetrees, Government Geologist.

E. E. MEYER, of Allegheny, Pa., issues a table of volumes through air-ways, in cubic feet per minute. It is a useful table and is printed on cardboard. Price 25 cents.

ECONOMIC GEOLOGY OF THE INDEPENDENCE QUADRANGLE, KANSAS, by Frank C. Schrader and Erasmus Haworth. Bulletin No. 296. U. S. Geological Survey.

THE GEOLOGY AND WATER RESOURCES OF THE WESTERN PORTION OF THE PANHANDLE OF TEXAS, by Charles N. Gould. Water-Supply and Irrigation Paper No. 191. U. S. Geological Survey.

GEOLOGY OF THE MARYSVILLE MINING DISTRICT, MONTANA. A study of igneous intrusion and contact metamorphism, by Joseph Barrell. Professional Paper No. 57, U. S. Geological Survey.

Trade Treatises.

ALLIS-CHALMERS CO., Milwaukee, Wis. Bulletin No. 1,060, on Allis-Chalmers Belted Alternators, of the revolving field self-contained type.

THE FRUE VANNING MACHINE CO., of San Francisco, has issued pamphlets on the Frue vanner, and the 'Brownell Patent Lip Flange' concentrator belt.

THE BUCYRUS COMPANY issues an elaborately illustrated and beautifully printed reprint of the President's message on the Panama canal. An excellent map of the Canal Zone accompanied the message, and is included in this pamphlet.

AN artistic catalogue (No. 22) of Chicago Giant rock-drills and kindred appliances is being sent to the trade by the CHICAGO PNEUMATIC TOOL CO. The book is printed in colors on high-grade paper and contains 96 pages of matter referring to rock-drills. The text is well written and fully explanatory, and is embellished with half-tone engravings illustrating the Chicago Giant rock-drills and views of parts, followed by several pages devoted to rock-drill steels, and a description of the method of lubrication. Several pages are devoted to Franklin air-compressors, another of the company's products, followed by illustrations and descriptions of the Baby Giant or One Man rock-drills, and scenes at work. Copies will be forwarded upon request by addressing the Chicago Pneumatic Tool Co., Fisher Bdg., Chicago, or 95 Liberty St., New York.

Commercial Paragraphs.

L. H. WYGANT, JR., for the past seven years with J. Geo. Leyner Engineering Co., is now associated with the F. M. Davis Iron Works Co., at Denver.

GOODALL, PERKINS & CO., western distributors for the Gold Brand Fuse, announce removal of their headquarters from Oakland to 24 Market St., San Francisco.

A. LESCHEN & SONS ROPE CO. has removed the New York branch office from No. 163-165 Washington St., to the West Street Bdg., on West and Albany streets.

THE HOSKINS COMPANY, of 93 Erie St., Chicago, send us a sample of their Brownite cupel, which is guaranteed not to break in transit. The one sent to us arrived in excellent condition.

THE CLASON MAP CO., of Denver, Colo., has published a new map of Arizona in the form of a folder. The retail cost is 25c. It is an excellent map, and ought to be of service to mining engineers.

BRODERICK & BASCOM ROPE CO., owing to increased business in New York and its vicinity, has found it necessary to move the branch house from 19 Murray St. to larger quarters at 76 Warren St., New York.

OSCAR J. FROST, assayer and chemist, of Denver, has removed his office from 1752 Champa St. to 511 Eighteenth St., two doors south from the Adams hotel, where he will be pleased to meet all of his clients. His new quarters are much better adapted for his work than the old place.

THE CYCLONE DRILL CO. informs us that J. C. Evans, of Youngstown, Ohio, has just returned from Zaragoza, South America, where he has been operating Cyclone drills, prospecting a placer property for the South American Development Co. The results were highly satisfactory. A dredge is likely to be sent on the ground.

THE LEONARD-HEISNER MACHINERY CO., Boulder, Colo., successors to the C. W. Knox Machinery Co., will install a complete plant for making cyanide and concentration tests on ores. This plant will be large enough to handle one-ton lots. Frank Leonard, who has been operating the Cash mine and mill at Magnolia, Boulder county, is manager of the company, and will have personal charge of the testing plant. It is also the intention to handle new and second-hand machinery, but principally new. They are now securing their agencies for the East.

THE CONSOLIDATED EQUIPMENT CO. of 17 Battery Place, New York, has been appointed selling agent for the Emerson pump. This company's well known triple vertical cylinder contractor's pump will be supplemented by a new product—the Emerson Junior. This pump is made with but a single cylinder, weighs but 219 lb., and has a capacity of 100 gal. per min. against a 25-ft. head, and about half this capacity on a 100-ft. head. A stock of regular and Emerson Junior pumps will be kept on hand in New York and at the factory in Alexandria, Va., which is to be enlarged to accommodate this new design.

FOUR of the largest silver-plated copper plates ever made for the recovery of gold in stamp-mill work have been recently completed for the Quartette Gold Mining Co. of Searchlight, Nevada, by the SAN FRANCISCO PLATING WORKS, E. G. Denniston, proprietor, 1349-1351 Mission St., San Francisco. Each of these plates is 5 ft. wide by 15 ft. long, containing 75 sq. ft. of amalgamating surface, and it is made of specially soft copper sheet heavily plated with refined silver. With the greatly enlarged capacity of the San Francisco Plating Works, silver-plated copper plates of any dimension can be produced.

Dividends.

On June 4, the Bunker Hill & Sullivan Mining & Concentrating Co. paid dividend No. 117 of $180,000. This makes the amount of dividends paid this year $1,080,000, and total to date $8,946,000.

Editorial.

THE AMERICAN MINING CONGRESS will hold its tenth annual session at Joplin, Missouri, on November 11 and the five succeeding days.

IT HAS BEEN ASCERTAINED, after careful investigation, that during 1906 as much as $1,500,000 of ore was stolen from the mines at Goldfield, Nevada. Of this amount $250,000 has been recovered and the remainder lies hidden or cached awaiting a safe chance of sale to the smelters. In the meanwhile, it serves as a constant menace to statisticians, for while it was mined in 1906 it may be marketed in 1907, 1908, or even later. 'High-grading,' as the theft of ore is termed in the West, is the expression of anarchistic notions of property rights.

PATHETIC INTEREST, of a deeply regrettable kind, is attached to the letter from Chihuahua appearing under 'Special Correspondence.' It was written by H. L. Shrom. The day after he sent it, he fell 125 feet in one of the workings of the Palmilla mine, at Parral, and was instantly killed. We did not know him personally, but his letters, which he had begun to send only three months ago, were models of their kind, in crispness of statement and value for news. Only 36 years old, full of vigor, an earnest capable man, this untimely end is particularly sad. Good men are scarce. There are so many of the useless and vicious, who could be spared without any sense of loss, that we feel deeply the deprivation of men of real character and high purpose.

ALTHOUGH THE ANNUAL REPORT of the Amalgamated Copper Company gives, as usual, only a skeleton balance sheet and the mere pretence of an income account, it demonstrates one interesting fact, namely, that increase of profits is not in direct ratio to the rise in the price of copper. In 1905 this company's report said that "a fluctuation in the price between 11.7 and 16.5 cents per pound (the highest and lowest prices during the past five years) means a difference to a copper company of the magnitude of the Amalgamated Company of $9,700,000 in annual earnings, or 6 per cent on the capital stock." In 1906 the price ranged between 18 and 25¼ cents, as against a range of 18.87 and 15 cents the year before, and yet the gain in profits was only $4,992,000. What became of the balance? This is an example of the financial methods that have disgraced Amalgamated and caused it to be regarded as a blind pool.

SOME CANADIAN PAPERS have protested against the recent change in postal rates, but most of them, like our friend, *The B. C. Mining Exchange*, are inclined to take the increased impost in a reasonable manner. It

appears that Canada was doing nine-tenths of the work and getting only one-tenth of the revenue paid by second-class matter, and the post-offices at the border were burdened with an immense volume of yellow journals, especially the Sunday issues, with their weary drivel and hideous supplements. We have raised our subscription so as to meet the extra charge and no one has objected, for eight cents per copy is not much to ask for an earnest technical journal, seeing that it is less than the price paid in a mining camp for a poor cigar or a drink. The most expensive items in modern life are the carfare that takes you three blocks and the daily paper containing all the news that is unfit to print and a few facts distorted beyond recognition.

ENLARGEMENT OF BLAST-FURNACES continues at the Washoe plant of the Anaconda Copper Mining Company. The 87-ft. furnace seemed an achievement, for it has treated as much as 2,800 tons of charge per 24 hours, but now it is planned to make a furnace 126 feet long, by joining four existing furnaces and so utilizing the space between them. Incidentally, we make mention of the recent collapse of the big flue, leading to the main stack. It collapsed for a length of 108 feet at a place where it is 60 feet wide. This was due probably to weakening of the structure caused by the variation in temperature. At the same time the dust-chamber behind the blast-furnaces also collapsed, possibly by accumulation of gases held back by the closing of the flue. It took only four or five days to repair the flue, and a couple of weeks to bring the dust-chamber into serviceable condition. To Mr. E. P. Mathewson is to be credited much of the ingenuity and progressive spirit exhibited at this great copper smelter.

WE GIVE SEVERAL PAGES in this issue to an article on the filtration of slime during cyanidation by Mr. E. M. Hamilton. Next week our readers will get five more pages on the same subject. Those who are interested in the matter will appreciate the reason for giving so much space to Mr. Hamilton's article, which is one of the best that has been published during the last ten years. We confess also that he won the cordial esteem of the editor by the unusual excellence of his writing, both as to style and accuracy. It is rarely that a metallurgist so thoroughly the master of an important branch of practice is also so thoroughly competent to tell how his work is done; unfortunately too few of the men that really do things are endowed with the facility to say how they do it; therefore, the editor of a technical journal finds reason for felicitating his readers, and himself, when so notable an exception is afforded. Those of us who have taken an interest in the development of the cyanide process, especially of late in Mexico, are aware that to Mr. Hamilton belongs credit for the pioneer work on silver ores at Guanajuato and Pachuca. To Mr. Charles Butters also, to whom some of the most important of the early progress on the Rand is due, this article on his invention is a compliment that we are glad to offer, as being well earned.

Support the Law.

AT THE PRESENT TIME San Francisco is serving as a warning to other modern communities; the day will come, we hope, when she may be held up as an example of enlightened progress. In the meanwhile this City only illustrates another aspect of the feature we emphasized in our last issue, namely, the lack of strong public opinion in support of the law. To most people the self-confessed malefactor Orchard and his fellows are obvious enemies of society, in that they destroy the safety of life and the order of business, but it is equally certain that in the eye of the moralist or the political economist, Schmitz, Ruef, and the rest of them are anarchists also, in that they corrupt municipal government and cultivate a putrid kind of political idea, that is, they undermine the very foundations of the art of living in a big city. We go even further and say that those representatives of the corporations who took advantage of the City's weakness and its easily corruptible officials in order by bribery to get their franchises, gas rates, or other concessions, were also anarchists, because they lent a hand in destroying the fabric of a complicated civilization. And if they are better educated men, possessed ordinarily of higher notions of honor than the Schmitzes and Orchards, they also are more deserving of censure and punishment, for they were false to their own code. It will be said by way of excuse that they are the victims of conditions under which this community has grown up and that they are now sacrificed to a spasm of virtue. Let the excuse go for what it is worth.

The City and County of San Francisco has been outraged long enough both by capitalists and workmen; it is a pitiable fact that at this juncture the integrity of local government is represented by one official only, namely, the District Attorney, who has succeeded in getting indictments against a few of those implicated in the venality and misgovernment that have made San Francisco the talk of the world. It may be explained to our mining friends in Australia and South Africa that the Federal Government has no finger in this pie, nor has the Governor of the State any right to interfere, until insurrection occurs. The President undoubtedly has exerted some personal influence, but officially he has no more to say in these our troubles than the Archbishop of Canterbury. It is true, the Governor has been here and has made some remarks, varied by pronunciamentos that were accepted as the blank charges of a dress parade, but, being himself the product of a corrupt political condition, he has not the influence that such an official ought to have in this great Commonwealth. So this City, divided against itself, must settle its own affairs. The remedy had to come not from without, but from within. The mayor, the first violin of a vaudeville, elected as a laboring man on a labor-union ticket, had lent himself to corrupt agencies. The officials appointed by him were men of no character when they were not men of bad character. The Chief of Police is a disgrace to his office,

and is under indictment for extortion. The Board of Supervisors are confessed criminals. The various inspectors and commissioners are petty politicians, irresponsible and utterly discredited. Fortunately one official, also elected by the popular vote, also on the labor ticket, proved to be a good citizen. That was the District Attorney. But he had not all the ability and none of the funds required to undertake a wholesale investigation and prosecution. At this juncture, Rudolph Spreckels, a rich merchant and banker, undertook to provide the $100,000 required to make a fight for San Francisco's honor. This sum permitted the District Attorney to engage a skilled detective and a brilliant advocate. Thus were obtained the money and the men to redeem the City. The result has been heralded to all the world. Schmitz is in jail, others stand within the shadow of its dark portals; all the little fellows are running to cover and confessing; the rich men have hired the leaders of the bar to defend them. And now—I speak to the gentlemen in South Africa and Australia—it is a curious fact that a large part of the community is taking sides against the District Attorney and those that support him in an effective crusade, because forsooth this Mr. Spreckels has motives for financing the prosecution, the members of it are hired bravos, and the District Attorney himself is merely a puppet. So they say. Just as the Western Federation of Miners and its agents were able to terrorize Colorado and Idaho for twelve years, because there was no strong public opinion in support of the law, and the people of those States looked upon the affair as a vendetta between the mine-owners and the mine-workers, so here in this City of San Francisco the community is inclined to look upon the prosecution of the bribers and the bribed as a contest between rival factions, fighting for office, for spoil, and for franchises. Plenty of opinions are expressed, and there is a tendency for members of this community to take sides as determined by social, political, or financial affiliations. Speaking generally, the camaraderie of a club is more apparent than the civic spirit that makes a City something more than an agglomeration of buildings and car-tracks. What is wanted is a realization of the supreme importance of subordinating private interest to the common good. To us—and we hope to our friends in South Africa and Australia—it is plain that the officers of the law must be upheld, that the official representing this community in the punishment of crime must be supported; at the present moment the only representative of popular government in San Francisco is William H. Langdon, the District Attorney. He is entitled to the undivided and wholehearted assistance, goodwill, and encouragement of every citizen. If he is getting aid from Francis J. Heney, a lawyer that represents the law when so many in his profession are defenders of lawlessness, let us be thankful that his assistant is an advocate so skillful and energetic. If he is getting financial aid from Mr. Spreckels, let us be grateful to the citizen that contributed the funds for so worthy a purpose; if the motives of Spreckels are good, so much the better; if they are bad, he will lose a supreme honor; in any case, his motives are of no consequence. The cause of decency is in the hands of the District Attorney, and no matter what his politics or his other deficiencies, if any, it remains only for every believer in democratic government to support him as the properly constituted representative of the law in this community. Unless we return to first principles, this San Francisco will be as infamous for her politics as she was made famous by an unkindly act of nature. Earthquakes and fires we can face, the effects of them we can overcome, but the corruption of our civic life can end only in the destruction of political liberty and industrial vitality.

A Strike on the Rand.

THIS does not refer to a find of rich ore but to the efforts of labor agitators. It so happens that our correspondents at London and Johannesburg both refer to the incident, and we have also received a letter, published in this issue, from Mr. E. P. Rathbone, late Inspector of Mines for the Transvaal. The general opinion appears to be that the strike is so unjustified as to be certain of failure. Mining on the Rand has had to overcome many unexpected difficulties, industrial and political, and we would be sorry to see a further factor of uncertainty introduced into a business once claimed to be an investment far above all other forms of digging for gold. The immediate result has been to attract attention to the tremendous wages earned by the men that operate machine-drills at Johannesburg. Even to a dweller in San Francisco, where hod-carriers get higher pay than professors at the University, the average of £2 per shift of 8 hours, with a maximum of £4, seems extraordinary, especially when it is followed by a demand for further concessions. And it must be remembered that these men are bosses rather than drill-men, the actual handling of the machine being delegated to Kaffirs or Chinese. We read also that the white men object to bossing more than 25 natives, unless they get more pay. All of which serves but to prove how intelligence can be smothered by greed and, for the thousandth time, that the workman is too often his own worst enemy. At a time when hundreds of stalwart college men are willing to work in the mines at Butte, Bisbee, and the Coeur d'Alene for $3 to $4, it seems queer to read of Europeans that grumble at £2 per shift. And our friends underground in Idaho and Arizona work hard, they do not merely direct the labor of an inferior race, as is done by the white men that are listening so sympathetically to the walking delegate on the Rand. Of course, we are aware that the conditions in South Africa are unhealthy, by reason of the quartz particles in the air of the stopes and drifts, causing silicosis, but the effects are due largely to the disregard for ordinary precautions. Young men, willing to use respirators and take care of themselves, could work for a year or two, at least, without danger to health and could get money and experience in a pleasant way. We shall be surprised if a few capable men do not go to Johannesburg.

Personal.

W. S. NOYES is in Mexico.

H. KILBURN SCOTT is in India.

MARK R. LAMB is at Chihuahua, Mexico.

HERRERT HAAS has returned from Mexico.

EUGENE BRADEN has returned from St. Louis.

FRANKLIN GUITERMAN was in Salt Lake last week.

R. F. GIBSON, of Grants Pass, Oregon, is in this City.

D. D. ROSEWARNE is on his way to Cobalt and Larder lake.

F. LYNWOOD GARRISON is at Los Angeles, on his way to Mexico.

H. C. CALLAHAN has returned to San Francisco from Elk City, Idaho.

E. R. ABADIE, JR., has charge of a mine in Tuolumne county, California.

FRED. H. DAKIN, JR., has left this City to go to examine mines in Siskiyou county.

JOHN A. REID has been examining the Cerro Gordo mines of Inyo county, California.

BERNARD MACDONALD is in New York, where he now has an office at 40 Wall Street.

R. L. LLOYD has returned from Chile to secure a few mechanics for the Braden Copper Company.

H. P. GARTHWAITE, resident director of the Butters Salvador mines and Butters Divisadero mines, is on his way to San Francisco.

ARTHUR H. BROWN has been appointed superintendent of the Lower Mammoth mine at Tintic, Utah, succeeding William Ball, deceased.

FRED. G. FARISH sailed from Genoa on June 5 on his way to the Dutch East Indies to examine mines in Celebes; he will return about September 15.

E. E. CARTER, formerly associated with the Sullivan Machinery Co. as mining engineer, has accepted a position with the Traylor Engineering Co. of New York.

JOHN V. N. DORR has gone to the Black Hills for a few weeks where he will re-open the Lundberg, Dorr & Wilson mill at Terry, and also the new mill of the Mogul Mining Co., at Pluma, of which he has charge as consulting metallurgist.

Obituary.

HENRY G. HANKS, at one time State Mineralogist of California, died at Alameda last week, at an advanced age. He was well known to prospectors on this Coast as an assayer and mineralogist. His son, Abbot A. Hanks, succeeded him as assayer about ten years ago.

JOSEPH CROWTHER died at the Etruscan mines, in Italy, on May 12. He fell down a shaft and was instantly killed. Only 29 years old, he was one of the most promising of the graduates from the Royal School of Mines, where he was a medallist in 1895. He was lecturer in the South Australian School of Mines in 1902. A brilliant career has come to an untimely end.

H. L. SHROM died at Parral on June 12. On the afternoon of that day, Mr. Shrom fell into a shaft at the Palmilla mine, and only lived a few minutes. He and Mr. Cornell (of New York) were together, laughing and talking in a light-hearted way, when he stepped off the edge of one of the many treacherous holes in that mine, and fell a distance of 125 ft. It was the carelessness that often comes with perfect confidence in one's intimate knowledge of danger. Mr. Shrom was a man who won the love and respect of all who knew him. Every one at Parral is mourning his loss, for it is one that cannot be measured. He was a man of high integrity and lofty ideals. He was dearly loved by those who knew him intimately. His body was taken to his home in Greenville, Pa. He was only 36 years old.

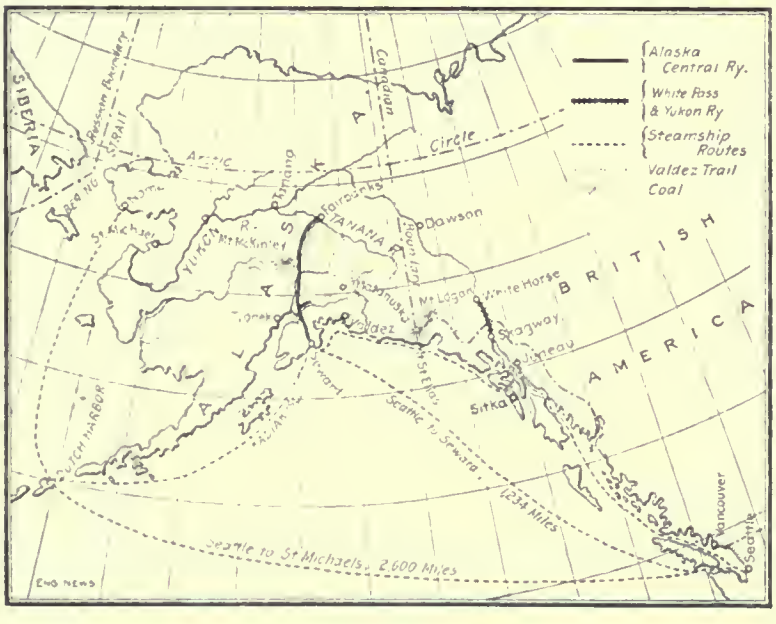
General Mining News.

ALASKA.

The annual report of the Alaska-Mexican company, operating on Douglas island, states that the receipts during 1906, for free gold, were $392,773, and for sulphide concentrate, $328,696. The mining expenses were $332,645, milling expenses, $62,200, sulphide treatment charges $25,705, and total expenses $443,100, leaving a net earning of $261,127. Dividends amounting to $216,000, or 24%, were paid and the undivided surplus on hand was $127,123. The average value of the mill tailing was $0.18, and the total gross value of the ore, $3.22 per ton. The mine statement shows 328,627 tons of ore broken, 182 ft. of shaft sinking, 1,760 ft. of rising, 441 ft. of stations and skip-chutes, and 4,857 ft. of drifts and cross-cuts. The mill is equipped with 120 stamps. The ore reserves developed were 856,390 tons, all being below the 440-ft. level.——The first 30 stamps at the Alaska-Perseverence have begun to drop. Parts are lacking for the 20 additional stamps that are in place, so they can not be operated. About 70 men are employed by the company. At the Pacific Coast wharf are eight carloads of machinery awaiting transportation to the mine.——At Whitehorse, there



Map of Alaska.

is much prospecting, and development is proceeding on the Pueblo, Copper King, Grafter, and Arctic Chief properties. A copper discovery is reported at Burwash, 20 miles from White river.——A new compressor, water-wheel, and electric generator have been purchased for the Alaska-Rubicon and the Penn-Alaska companies. Jesse Blakely is the managing director. These claims adjoin the Perseverenee ground. A contract has been let for the Penn-Alaska tunnel, and the Rubicon tunnel will be driven under the direction of C. M. Thorndike.——At Ketchican, small shipments are being made from the Uncle Sam mine, formerly called the White Eagle, to the smelter at Hadley. Shipments are also made from the Hydah, where the gravity surface tram is working smoothly. The Goodro & Thomas and the Polson & Rush properties at Karta bay are showing up well with development. A steamer left last week with 2,600 tons of Mt. Andrew ore, and another with 1,000 tons of Rush & Brown ore from Karta bay.——A strike is reported from the Niblack at the bottom of the shaft, on the 300-ft. level. The daily output of the Mamie is being gradually increased, and also that of the Mt. Andrew and Stevenstown. The Mt. Andrew is shipping at the rate of 4,500 tons per month, while the Stevenstown sends about 100 tons per day over the tram to the Hadley smelter.——Two thousand tons of ore from the Jumbo are awaiting shipment. ——The smelter at Hadley will shut down temporarily on account of a shortage of coke.——At Valdez much development work is being done. La Touche Island Copper Mining Co., which is handling the property acquired by George Barrack and James Girdwood, has a wharf completed and a tramway equipment on the ground. Over 500 tons of ore are on the dump and shipments will start within six weeks.——Some rich float copper ore has been found on the property of the Singer Mining Co., on La Touche island. ——Some good copper ore has been discovered at Long bay, just below Glacier bay. Huie Goodell and W. A. Johnson made the strike.——The Hogan bay property of the Happy Jack Mining Co. will soon be in shape to ship ore. In Mummy bay, this company has a group of six claims, on which a tunnel has been run for 150 ft. A copper strike is reported from Knights island, but details are lacking. The tramway from the Standard Copper mine, at Landlock bay, to the beach, will be completed in a few weeks.

The United Mine Workers of the Tanana, to the number of 3,500, are still out on a strike for an eight-hour day. They are warning all union men to keep laborers away from the district in order that they may win the strike.

ARIZONA.

GILA COUNTY.

The Gila County Copper Co. has been shipping a large amount of concentrate to Globe. Most of the milling ore was stoped in the San Juan mine, although other claims are looking well. An orebody 28 ft. wide was encountered on the 230-ft. level, which easily keeps the mill running.

GRAHAM COUNTY.

The output of the Shannon company for May showed an increase, being 720 tons of bessemer copper. This company will probably average about 700 tons per month throughout the year. The foundation for a new furnace has been completed.——The output of the Arizona Copper Co. for May was 1,380 tons of bessemer copper, a slight increase over the production of April. The plant has been overhauled and the property is now in good shape. The company has recently built several large shallow tanks in which the fine material from the leacher and the slime from the concentrator are impounded and settled. The fine from the leacher runs well in copper and is mixed with flue dust and run through the converters, while the slime from the concentrator is used at the smelter for a converter lining. This treatment is expected to effect a good saving, as the material was formerly dumped into the river.

MOHAVE COUNTY.

A mill will be built at the Oro Plata mine, of which John Boyle, Jr., is the superintendent.——Work will be resumed on the Victor-Paymaster mine. Fred N. Chandler has just completed an examination of the property.——Plates have been put in the Vanderbilt mill at Corbat, which give good results with the oxidized surface ores.——The Keystone mine is being unwatered so that an examination of the property can be made. This mine was worked over 30 years ago.——In the San Francisco mine at Cedar, water was encountered in a drill-hole on the 600-ft. level, under so great a pressure that it has been piped to the surface and flows into a tank that supplies the mill with water.

YAVAPAI COUNTY.

(Special Correspondence).—Another shift was put at work on the Black Hills group at Jerome this week. The work will be pushed as rapidly as possible to tap the outcropping vein. At the Mingus Mtn. property, preparations are being made to ship a little ore to the smelter for a sample run. This property is showing up some excellent ore as development proceeds.——At the Little Daisy mine, the work of cutting a station has been commenced, and a pump will be installed and the shaft continued down. The property is a

most encouraging one.——J. J. Shaw, president and general manager of the Mazatzal Copper Co., is in the Tonto Basin country at present, looking over the company's property there. Encouraging reports continue to come from this mine, and 20 men are employed. The Verde Grande Copper Co. has a shipment of machinery coming from Los Angeles that will be the largest plant yet brought into Jerome for development purposes. At the mine, sinking with three shifts is being continued with good results. This property is developing at a rate that is a great surprise to many.——A party of mining men from Los Angeles visited Jerome the past week to look at the property of the Jerome Mines Development Co., one of the Haynes holdings, known locally as the Harryhousen group. They were well pleased with the property.——Charles Knutson was in Prescott from the Sycamore mine this week and reports that his company is cutting a station in the shaft in which they will install a pump, after which they will continue to sink.——At the Arkansas & Arizona, work on the shaft is being prosecuted with all the vigor possible, with the best of machinery and skilled workmen.

Phœnix, June 15.

YUMA COUNTY.

(Special Correspondence).—The Harqua-Hala mill is running steadily and making monthly clean-ups that are satisfactory to the owners.——The Ironwood & Arizona Development Co.'s shaft is down 275 ft. Faster progress is being made since the installment of the gasoline hoist. The altered ores are giving way to copper sulphides.——The Hercules mine has passed beyond the prospect stage and is well equipped with a pipe-line, steam-hoist, and machine-drills.——The San Marcus group of the Pittsburg-Harqua-Hala Co. promises to make good. A body of high-grade shipping ore has been encountered on the 450-ft. level.——The shaft on the Oro Cobre, which has attained a depth of 245 ft., shows a body of copper sulphides its entire width. Only by cross-cutting can the full size of the orebody be ascertained. The increasing inflow of water makes it necessary to replace the whim with a steam-hoist. The vein showed fairly well on the surface, and did not improve much as depth was attained, until the permanent water-level was reached.——J. W. Boone is working the Cunningham mine and is making regular shipments to the Humboldt smelter. The ore runs about $100 per ton in copper and gold.——Josephi & Wilkinson have bonded their group of claims to Eastern parties.——The Victor & Bell Crown Mining Co. has concentrated its work on the Bell Crown No. 3. They reeently let a shaft contract of 100 ft., which will when completed reach the 250-ft. level. The vein is about 5 ft. wide and shows about 3 ft. of ore at a depth of 150 ft. Shipments made to the Humboldt smelter gave net returns of $128 per ton in copper and gold. When a steam-hoist is installed regular ore shipments will follow. The Bell Crown No. 3, Ora Cobre, and Copper Bullion are all on the same line of contact. The ore throughout lies next to the diabase dike forming the hanging wall, and in the lower workings alteration of the dike is noticeable.——The Bunker group of claims, which are bounded on the east by the Ora Cobre and Copper Bullion, was sold last week to Bisbee parties.——The Montana & Arizona Co. has just received a 60-h.p. gasoline hoist to replace the 12 h.p., with which they succeeded in reaching the 400-ft. level.

Salome, June 10.

CALIFORNIA.

AMADOR COUNTY.

About 60 men are working at the South Eureka mine, at Sutter Creek. Experienced miners are scarce and this company is constantly on the lookout for more men.

BUTTE COUNTY.

A party of shareholders is inspecting the Gold Bar Mining Co.'s property, where it is intended to work a series of dredges.——Deposits of chromium and iron are reported as having been found on Middle Butte creek, by S. E. Starrett. The chromium carries some nickel.

EL DORADO COUNTY.

A contract has been let to A. B. Eastwood to sink the Scherrer shaft 200 ft. deeper.——Work is progressing on the new Vivian mill. Jay Sawyer is in charge.

INYO COUNTY.

News comes from Bishop, that S. P. Roberts has sold the Golden Gate and St. Louis groups of claims at Pine Mtn., to W. J. Nelson, of Los Angeles. These groups include 25 claims, situated 20 miles east of Laws, and near the Index group. C. H. S. Morris is the superintendent.—The Inyo Mines Syndicate will begin work on the Red Rose group. The road to the mine is being put in shape.——Two carloads of ore were shipped last week from the Lucky Jim mine at Darwin.——Oglesby & McDonald have just completed examinations of the Black Canyon mine, and the Reward property near Independence.——W. D. Clair has purchased the Stone & Pendry claims in the Sherwin district.

NEVADA COUNTY.

A force of men has been employed at the Norambagua, cleaning out and retimbering the old tunnel, in preparation for a visit from shareholders from Pittsburg, who are coming to inspect the mine.——The Dolly Madison G. M. Co. has made the final payment on the claim which it has under bond from S. W. Weeks, of Randolph Flat. This ground adjoins the Hay claims.——An assessment of 5c. per share was levied at the recent annual meeting of the Zeibright Mining Co. The directors elected were Fred Searls, William Giffin, Alex. Hongel, J. J. Jackson, W. F. Englebright, and James F. Colley. The reports from the mine are encouraging, and development work is proceeding.——The Conlan mill of 10 stamps has started, and a quantity of ore has been developed. The Lafayette and Comet claims have recently been purchased by this company.——The antimony deposit on the Johnson property will be explored by L. C. Heler, who will run a tunnel in on the vein.

SHASTA COUNTY.

One of the two furnaces of the Bully Hill smelter has been torn out, and the converters have been removed, preparatory to remodeling the smelter. About 100 men are employed on repairs and in the mines here and at Copper City. The company has let a contract for burning a large kiln of brick.——At Knob, the Midas company has its new hoist in operation, and is putting on all the miners it can get.

SISKIYOU COUNTY.

A new hoist has been ordered for the Yellow Butte company, operating in the Butte district. J. D. Ball is the manager.——Work has been started on the Daggett gravel claim on the Klamath river. A new method is used, the gravel being hauled up by a steam scraper on an incline, somewhat like a bucket dredge.——A small force is employed at the Golden Eagle mine. W. Baker is the superintendent, with Ed. Baker in charge of the mill.——A force of 10 men is working in the Quartz Hill mine, at Scott Bar. L. D. Crawford is the superintendent.——Lewis & Boyer have bonded their mine below Fort Jones, to a Colusa company.——Work has been resumed at the McFadden & Champion mine, near Callahan, which was forced to close last winter on account of the heavy snow. This property is under bond for $45,000.——The first carload of ore has been shipped from the Dr. Maggi mine, near Callahan, to the Kennett smelter. A wagon road has been completed to the property.——The Vulcan Copper Co. is building a road to the Uncle Sam mine, in order to take a diamond-drill and machine-drills to the mine. About 10 men are employed at the mine.

TUOLUMNE COUNTY.

Negotiations are on between Louis Rosenfeld, of the Eagle-Shawmut Mining Co., and T. S. Bullock, which may lead to the leasing of the Yosemite Short Line railroad between Jamestown and Shawmut, a distance of eight miles.——Sinking has been discontinued in the Clio mine, and a station is being cut at the 650-ft. point, preparatory to running a cross-cut.——F. B. Keever, president of the Lion Mining Co., announces that J. F. Parr will succeed J. L. Bryson as superintendent of this company.——Oakland parties are trying to get hold of the Pereira mine, near Jamestown.——The old shaft at the Confidence mine is being unwatered in order that work may be continued in the new shaft, into which the water has found its way.

COLORADO.

CLEAR CREEK COUNTY.

(Special Correspondence).—The Main Gulch company is meeting with great success in its operations on the Smuggler mine, above Silver Plume. The shaft is down about 250 ft. In the third level west a fine vein of ore from 10 to 18 in. wide has been opened up for 75 ft.; shipments of this ore have returned 200 oz. silver per ton. There are now three sets of lessees at work in the mine. Erickson & Co., working on the third level east, are shipping regularly ore that averages 86 oz. silver per ton. At the fourth level the drift is being run east to come under the ore-shoot in No. 3 level. The shaft will be sunk another 75 ft. and drifts run east and west. C. I. Burt, of Silver Plume, is in charge of the property.—— The Scotia M. & M. Co., operating the Scotia & Maine lodes, on Sherman Mtn., and the Scotia mill at Silver Plume, has driven through the porphyry dike which cut off the vein and caused the suspension of work in the mine several years ago. After driving 40 ft., a vein of lead ore was encountered from 16 to 20 in. wide, and a heavy production should result from this discovery, as the ground ahead is all virgin.—— The Muscovite Mining &

Map of the New Mining Districts of Nevada and California.

Leasing Co., recently incorporated by Denver men, has purchased the Dewey tunnel-site from E. E. Grubb. The property consists of a tunnel-site 3,000 by 3,000 ft., and 40 lode mining claims on Alpine Mtn. This district has been very little prospected, owing to the deep slide. Work has been started on the tunnel-site and important discoveries are looked for. The same company has started work on the West Muscovite property, on Democrat Mtn., where there is a good vein of lead ore opened up, 18 in. to two feet wide. This is now being driven upon, and stoping will shortly be commenced.—— Chas. Estelle & Co. have taken a lease and bond on the Whig property on Democrat Mtn.; the main adit has been cleaned out and re-timbered and is in a distance of 110 ft. There is a 12-in. vein of lead ore in the breast which assays 8 oz. silver, half an ounce gold per ton, and 40% lead. This property has been lying idle for over 30 years. The lessees are now driving the adit ahead.—— The Linn Consolidated M. & M. Co., of which W. C. Hood and Frank A. Maxwell are the local representatives, operating the Mineral Chief and other lodes on Democrat Mtn., has now large bodies of smelting and concentrating ore opened in the eight levels of the property. With a view to most economically handling the ore, the company decided to erect a mill close to the C. & S. R. R. tracks below Georgetown, with a wire-rope tramway from the mine to the mill. The masonry-work for the foundation of the mill is now nearly completed, and work on the tramway will shortly be commenced. The tramway will be 1,000 ft. long and is to have a daily capacity of 75 tons. When the mill is completed the output of the camp will be largely increased, as the ore reserves in the mine are extensive.—— The East Argentine company has encountered, in the Sydney adit at a distance of 2,050 ft. from the portal, the footwall of what is proving to be a large lode, as 40 ft. have now been driven across the vein without striking the hanging wall. The whole lode is heavily impregnated with mineral. The Sydney adit is situated about five miles above Georgetown, on the East Argentine wagon-road, with every facility for easy transportation of ore. The machinery is run by water-power. M. Sydney is the manager.——C. E. Carpenter is in charge of the operations being carried on by the X-Ray Gold Mining Co., which has a lease and bond on the Doric properties on Saxon and Griffith Mtn. Men have been putting up a raise on the Cram lode, cut in the Doric adit at 2,450 ft. from its portal and some 2,000 ft. below surface. At about 100 ft. up, a fine vein of lead ore with copper pyrite has come in, which on this mountain always runs well in gold and silver.—— It is rumored that a smelter specially adapted to the ores of Clear Creek county is to be erected near Denver, with George G. Vivian as superintendent.

Georgetown, June 15.

SAN JUAN COUNTY.

A good copper strike has been made by M. T. Chestnut in the Carbon Lake mine at Red Mtn. The discovery was made in the 200-ft. level.——The Hercules Consolidated mill is about ready to start. The mill is equipped with two coarse crushers, 40 stamps of 800 lb. each, eight jigs, 18 Wilfley tables, and amalgamating plates. Thomas H. Kane is the general manager.——The Herbert Smith group of 10 claims, in Cinnamon gulch of the Animas Forks region, is being developed. About 50 prospecting pits have been sunk on the outcrops.——The cross-cut of the Silverton Mining Co. is being driven rapidly. It is expected that the Belcher vein will soon be cut.——The Precious Metals Mining Co. has let a contract to Jesse H. Kramer for 500 ft. of tunneling.——The Grand Mogul mill is running. The jig-capacity has been increased from 100 to 200 tons per day.——The Ross smelter is producing two carloads of copper matte per week.——The output from Silverton for May was 3,942 tons of crude ore, matte, and concentrate.

IDAHO.

IDAHO COUNTY.

E. O'Shea, of Spokane, holds the American Eagle mine, near Elk City, as trustee for the creditors of the American Eagle Mining Co., having bought the property for $15,000 at a foreclosure sale. It is understood that the creditors' claims amounted to $25,000. The property represents an outlay of $40,000 on their part. Mr. O'Shea says that the American Eagle Mining Co. has virtually gone out of existence, and the property has passed out of its hands. He has leased the dumps to Patrick Brennan and J. B. Honniger, and they have started the 10-stamp mill and are working over the ore. Their operations will last four months. Beyond that, there are no definite plans. The property has been idle two years on account of litigation among the stockholders.

It is reported in Spokane that work will be begun at once on a 1,000-ft. shaft on the Concord property in the Buffalo Hump district. The properties are controlled by Boston capitalists. Work was suddenly suspended on the company's properties after all of the winter's provisions and supplies had been laid in last year. This action was the cause of much speculation among mining men, as it is known that the company is well backed financially. Now rumors are current that the backers of the Concord have been working on a plan for the consolidation of the most promising properties in the district, outside of those controlled by Charles Sweeny, of Spokane. The big merger will include the Jumbo, the Crackerjack, and several properties on Mineral hill.

OWYHEE COUNTY.

Since the flood of water has abated, the work of reopening the adit on the shaft-house level has been resumed. The south drift on No. 2 level is being driven, and the face is in the ore-shoot that was encountered in the No. 1 level above. ——In the Village Blacksmith, a station has been cut and a shaft started 360 ft. from the portal of the tunnel. Good ore is showing in the bottom of the shaft, and the mine will produce steadily.——Many of the Banner stockholders from St. Paul and Minneapolis have visited the property during the last two weeks.

SHOSHONE COUNTY.

(Special Correspondence).—Work has been resumed with an electric drill on the West Hecla mine at Burke. It started 50 ft. in the tunnel that is being driven on the vein and will have to proceed 1,200 ft. before the ore is reached. This will be at a depth of between 800 and 1,000 ft. The development is being done under the direction of Arthur McCallum, formerly superintendent of the Standard mine

The Coeur d'Alene, Idaho.

at Mace. Three shifts will be placed at work.——Articles of incorporation of the Buckeye Copper Mining Co. have been filed at Wallace. The incorporators are S. P. Fairweather, W. Clayton Miller, C. W. Gibbs, E. F. Hall, John Benedict, L. Ryson, and T. S. Plummer. The capital is 1,500,000 shares of 25c. each. The company will develop a group of nine claims adjoining the Bullion property near the Idaho-Montana divide.——The Silver Mountain Mining Co. has been incorporated at Wallace, with a stated capital of $1,500,000. Directors and officers for the first year are: President, Joseph H. Astin, Gem; vice-president, Samuel T. Tennal of Mullan; secretary and treasurer, Joseph S. Pierson, Wallace. In addition to these Abe Wyman and E. Lindsly of Mullan are directors. The company will develop the Silver Mountain, Empire, Cyclone, Tornado, and Mill Dirt claims in the Hunter district.——The vein on the Coeur d'Alene Lead Silver Mining Co.'s property has been cut and is now being driven on. L. M. Porter, the manager, says it is three feet wide, and consists of quartz heavily mineralized with iron and lead. The strike was made 300 ft. from the portal of the lower tunnel. The property consists of four full claims between Wallace and Mullan, that are being surveyed for patent by M. L. Baldy of Wallace.——The Hornsilver mine on Placer creek, two and a half miles north of Wallace, is a low-grade gold proposition, according to assays recently made. A vein 150 ft. wide has been opened and a ton of ore has been taken from the lode, 100 lb. being taken at intervals of two feet from 40 ft. of the vein. This gave average assay returns of $4.80 per ton. A similar test was made of the other 110 ft. of the ore, which averaged from $1.50 to $1.60 per ton in gold.

L. McNeill announces that if mill-tests prove satisfactory a reduction plant will be installed.——Charles Sweeny, president of the Federal M. & S. Co., announces that the company has secured an option on the stock of the Nevada-Stewart company, with property on Pine creek. The Federal has been trying to get control of this property, together with the adjoining claims, for some time, and it was reported at Wardner that the Highland Chief and Surprise were included in the deal. The option holds for a year. Al Page, who represented the Sweeny interests in the deal, recently made large purchases in the Surprise and the Nevada-Stewart and secured the option on the latter in this way for the Federal company.——A three-foot orebody carrying values of $36 per ton was recently exposed in the 600-ft. tunnel on the Advance mine near Mullan. The silver runs $2.50 per ton, and the copper 6.5%. The ore is unusual in that it carries free gold visible to the eye. The property consists of five claims on Snowstorm hill.——Sinking on the first shoot of ore has been begun on the Vienna International mine on Placer creek, near Wallace. The mine has been equipped with machinery and at the point where the station has been cut and the winze started, the orebody is eight feet wide and nearly all of shipping quality. Stopes have been opened on the same ore-shoot between the two tunnel levels and some ore has been sorted and sacked for shipment. The upper tunnel has been extended to open the second vein and has cut the lode to a distance of 20 ft., with no sign of the hanging wall in sight.——Arthur A. Lewis, secretary and treasurer of the East Hercules Mining Co., reports that development is progressing, although only a small force is employed and the work is all done by hand. They are driving the cross-cut tunnel and have gone 127 ft., estimates showing that they will have to go 70 ft. further to strike the vein. A contract will be let for that much additional work in the cross-cut.——A certificate of increase of capital has been filed by the Bullion Mining Co., at Wallace. The capital has been increased from $1,000,000 to $1,500,000. This was authorized by a vote of 721,163 shares against 26,000. The proceeds will be directly used in the development of the mine.——George W. Ruggles, who holds a $60,000 option on the V group of claims on Pine creek, near Wardner, announces that work will be begun at once on a 1,250-ft. tunnel, which is believed will get under the surface outcrop of the vein. Some good galena ore has been found.

Spokane, June 15.

MISSOURI.

JASPER COUNTY.

The framework has been finished for the new 50-ton mill of the Deacon mine in the Richland Valley district, near Duenweg. The mill is on the south side of a 120-acre lease owned by the Trinity Zinc-Lead Smelting Co. J. P. Powell is general manager.——Just south of the Trinity property, the San Gabriel company has a new 500-ton mill. ——At Webb City, the Mercantile Metal Mining Co. has let a contract with the Southwestern Bridge Co. for a new 250-ton mill, to be built with a steel framework.

MONTANA.

BROADWATER COUNTY.

The Keating and Blacker mines are under lease and bond to the A. S. & R. Co. of East Helena. This company has spent over $100,000 on improvements, and produces from 30 to 50 tons of ore per day, which is hauled to Toston and shipped by rail to Helena. The company employs about 75 men and the shaft is down 335 ft.——The Simpson Mining Co. has a shaft down 180 ft. and ships about one ton per week of high-grade gold ore.——The Ohio Mining Co., owned by Mrs. Keating of Helena, has been a great producer.——This camp is provided with a 10-stamp custom mill.

NEVADA.

LINCOLN COUNTY.

(Special Correspondence).—Activity at Nob Hill has been pronounced. The Silver Legion company has resumed work in its old workings, and in the east drift on the 850-ft. level, ore has been struck. In an 18-in. streak there is wire and native silver, and some gold. The ore is being sacked and about 20 tons are ready for shipment. It is estimated that 250 tons can be produced within the next six weeks.——Development on the Eldorado Sphinx, east of the Legion, has brought to light some ore. In a winze in the Sphinx tunnel, a body of ore has been uncovered at a depth of 55 ft.——The width of the vein will be determined at the 100-ft. level, where cross-cutting will be done, and a raise put through to the surface. This is the first effort made to work the Sphinx for several years, owing to lack of money. Water has been developed and the property is in good shape. This is one of the mines worked 50 years ago by the chloriders.——A. K. Wright, of San Jacinto, has taken over the Jumper group of five claims. The property is developed by a 28-ft. shaft, from which some ore has been taken, and lies just south of and parallel with the Silver Legion, and adjoins the Eldorado Sphinx. A force will sink the shaft 100 ft. when driving will be done.——W. A. Miller has arranged to have 100 ft. of sinking done in the shaft of the Searchlight Belle, and it is expected this work will bring the shaft to the water-level.——The east drift on the Fortuna is being driven to connect with a shaft sunk on the vein 200 ft. east of the main workings, and as soon as this is completed the stoping ore between the 200-ft. level and the surface will begin. Extreme hot weather makes the workings warm, and until this additional air passage is opened only driving can be done.——A. A. McKnight is the manager.—Twelve men are employed, and this force will be increased and work continued throughout the summer.——Development on the Eldorado Consolidated has brought in a vein carrying pay-ore, and indications are that this property will show ore similar to the Daisy Bell, but a short distance away. A shaft is being sunk and driving will be done on the 100-ft. level.

Searchlight, June 12.

ESMERALDA COUNTY.

(Special Correspondence).—During the week just ending, 1,624 tons of ore, with an estimated value of over $200,000, was shipped fr m the Consolidated, Florence, Jumbo Ex., and Quartzite properties. Only the high-grade ore is being shipped.—— Several of the smaller companies and lessees have been compelled to suspend operations on account of the scarcity of money to pay off the men, and finance necessary development. With the exception of the more important mines, very little work is being done. There are more idle men here than there have been for months. From present indications the summer will be dull. The San Francisco strike, and the unsettled condition of the financial markets, are regarded as the chief cause of the depression.

Goldfield, June 15.

The quarterly report of the Goldfield Consolidated Mines Co., which has just been issued, shows that the funds in the treasury of the Consolidated and the constituent companies amount to $1,400,339. In addition to that sum, the bullion produced in May from the Combination mill amounts to about $119,000, making the total reserve $1,519,339.——With the financial report the manager of the company sends out a report regarding the general condition of the properties. From the report it appears that between February 1 and June 1 the underground development of the company has amounted to 3,536 linear feet and 135,121 cu. ft. in drifts, cross-cuts, and raises; 61,000 cu. ft. in stopes and 335 linear feet in shafts.——Sinking has continued in the Mohawk and a new level has been started at a depth of 450 ft. An additional hoist has been ordered and will soon be in place to continue sinking. This will allow the present hoist to work at its full capacity upon development and production in the levels now established. At the 450-ft. level the east cross-cut has passed through the main vein and drifts both north and south are in ore. On the 250-ft. level the orebodies left standing by lessees are being made available by new connections.—— Since February 1 the Combination mine and mill have been in operation only 68 days, so much time having been lost on account of labor controversies.——Some improvement in the mill practice has been made within the last four months, as a reference to the extraction for the quarter ending December 31, 1906, and the quarter ending March 31, 1907, will show, the indicated extraction for April and May being 95.5%, as against 85.6% for the quarter ending December 31, 1906. The present indicated extraction will probably be reduced to 94% by the smelter discounts on concentrate shipments, such discounts being the difference between what is paid by the smelter per fine ounce and $20.67 as paid by the United States mint.

WASHINGTON.

FERRY COUNTY.

(Special Correspondence).—The lower adit on the Gwin mine, at Covada, is in 345 ft. and has interseeted the main vein, 20 ft. in width, at a depth of 300 ft. vertically and 500 ft. on the pitch. The ore assays 9% copper, with $2 gold and 41 oz. silver per ton.——The adit on the Meteor mine, driven 630 ft. to the intersection of the first vein, will be driven about 40 ft. further, to cut another, which parallels it at the surface. The first vein cut is five feet wide, has a very rich streak, from four to 18 in. wide, on the foot-wall, and averages from $16 to $40 between walls. Gold predominates. A sorting-house has been built, and an ore-bin will be attached to it.——The Seal Mining Co. has purchased six claims on Bridge creek, covering a contact vein, from 40 to 60 ft. wide, between porphyry and diabase. It is traceable for 1,000 ft. The vein is iron-capped and has been tapped by an adit, driven 57 ft., at a depth of 30 ft., where the ore assays 49% copper and $2.20 in gold. A new adit will be started on the vein, which will gain a foot in depth for each two feet driven for a distance of 1,500 ft. Articles of incorporation have been filed for the Seal Mining Co. ——Articles of incorporation have been filed for the San Poil M. & E. Co., who will develop three groups of claims on the south half of the Colville Indian reservation. The directors of both the Seal and this company are Caspar Howarth, of Chester, Pa.; S. L. Boyer and A. L. Wright, of Spokane; John W. Mickle, Charles E. Skiles, and Mr. Hannaford, of Philadelphia, which is the principal place of business. The most important of the three groups is the Last Chance group, in which are 10 claims, situated at the heads of Nine Mile and the south fork of Bridge creek. The other groups are known as the Empire and Philadelphia. Some of the veins are iron-capped. The little work done by the original owners has exposed good silver-lead ore, chiefly carbonate.

Republic, June 8.

The Bortle Copper-Gold Co. has just purchased ground at the foot of Curlew lake, from Henry Zimmerman and Anna E. Kinney. It is reported that the company will build a railroad to Belcher, and erect reduction works on this new ground on Curlew lake.

STEVENS COUNTY.

(Special Correspondence).—A shaft on the Nellie S. mine, on a contact vein between granite and limestone, has developed ore which assays about $35 per ton in gold and copper, at a depth of 15 ft. The vein is eight feet wide. The main shaft was sunk 200 ft. on a four-foot vein; the newly discovered vein is 200 ft. west of, and dips toward, it. A cross-cut will be driven from the bottom of the main shaft, to intersect the eight-foot vein. This property is situated near Chewelah. The Viking Copper M. Co. has been incorporated to develop three gold-copper claims in the Pierre Lake district, by J. A. Maieil, P. Milkark, and G. H. Walters, of Spokane. The ore assays from $8 to $40 per ton.——The Wild Rose and Buckeye claims, on First Thought hill, have been sold to the Trophy Gold M. & M. Co., a new corporation.——Work has been resumed on the Trojan mine, in Pierre Lake district.

Republic, June 10.

Special Correspondence.

Chihuahua, Mexico.

Mining News From Parral.—Sale of Mines.—Active Exploration.—Shortage of Cars.—Prospecting All Over the State.—Branch Railroads.—New Silver-Lead District.—New Electric Plant.

Manuel Cameros has purchased the Mexicana property, situated on La Colorada Mtn., and has located all of the ground surrounding that property. The price of the Mexicana is said to be $100,000. The Vesubio, owned by General Zermeno and situated north of, and close to, Parral, is said to be under lease to Parral parties, who have already started work on the property and have taken out some ore running high in both lead and silver. The San Viciente Ferrer, owned by Carlos Guimbarda, and about a kilometre north of Parral, is reported sold to Denver capitalists.——In the Lamente district, Charles Sewell is working a force of men on the Lamentos mine for a company composed of himself, Luis Terrezas, Jr., S. Robinson of Chihuahua, John R. Allen of New York, and J. F. Johnston of Parral. Mr. Johnston has also taken out men to work on the Labrador, in the same camp.——The Cienega de Olivos is still attracting much attention, and many new denouncements are being made. The Delifina of that camp has made another shipment of ore running 24%, and 600 to 700 gm. silver. ——The Americana mine at Terrazas is reported unwatered, and will soon be extracting ore.

H. E. Thompson, of the San Salvador mine, in the Parral district, says that he has sufficient showing to warrant the installation of a complete machinery equipment at that mine. The Benito Juarez, close to Parral, is now said to be in good ore, and the work is being pushed as rapidly as possible. The Terrazas smelter people are working the La Maria mine, which adjoins the Rio Tinto, and are taking out about 200 tons of low-grade copper ore per month. The Tekamah, in the same district, is being developed by G. A. Lord and associates, of Boston. It is reported in Parral that the big Refugio mine is soon to start up, under the management of Phil Robertson. The shortage of cars is still causing much delay and trouble in ore shipments, and the promised 'better service' of the Mexican Central seems to be yet far away. Mr. Voorhees has leased the Las Vegas to S. Lawrence and associates for a term of years, the lease to go into effect the first of June. The deal for the Justicia mine has been closed, and the first payment made. The new owners intend to get a steam hoist and pump on the property as soon as possible, and commence work at once. All over the State of Chihuahua, but especially in the district east of Chihuahua, a good deal of prospecting is being done, principally for copper and zinc.

The Hines Consolidated Mining Co., which recently purchased the Clarinas and La Reforma group of mines, has completed the survey for the branch railroad that they propose to build from Santa Barbara to the mines.

Map of Mexico.

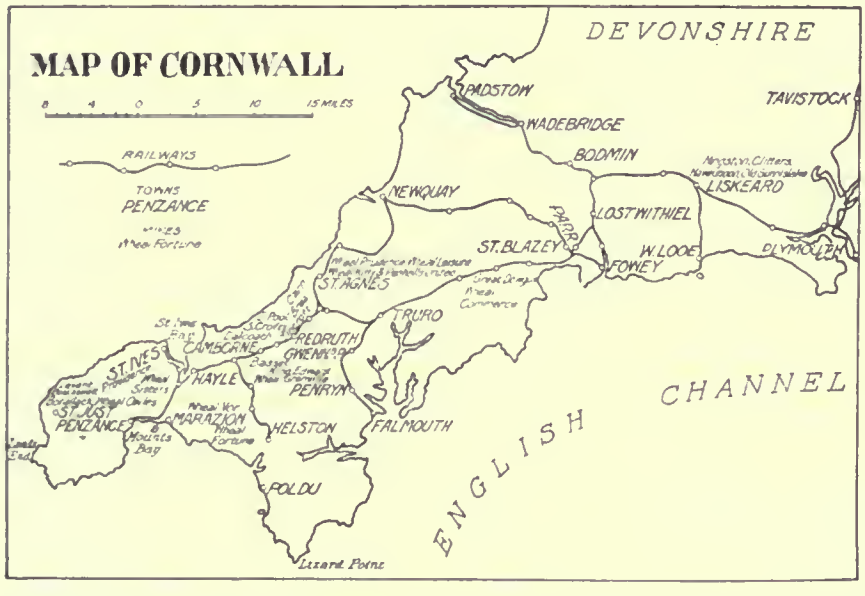
A special train of the stockholders passed through Parral on their way to Santa Barbara recently to look over the holdings of the company. It is rumored that this company is now in negotiation with the Hidalgo Mining Co. of Parral for all of the holdings of the latter.

The Mexican Mines Corporation is the name of a new company that has recently taken over several properties in the Almoloya district, and has started the sinking of a three-compartment shaft. The company's headquarters are at 25 Broad St., New York, and the company is said to be capitalized at $3,500,000. C. L. Graves is general manager, and W. D. Pearce is resident manager. E. J. Ernest is mine superintendent.——The mill on the Santa Barbara mine, belonging to the Rio de Plata Mining Co., is now completed, and will soon start up. The Mack Mining Co. is now working a property adjoining the Conchello, which was recently sold to the Green Gold Silver Company.

A new lead-silver camp has recently been opened up about 60 miles northwest of Parral, near Pillar de Concho, on the Conchos river. This is an old camp,

active about fifty years ago.——The McCausland Mining Co., operating the Los Bronces in the Santa Barbara district, has recently taken an option on several properties adjoining this mine, and expects to start work shortly.——The Cigarrera people, of the Almoloya district, are now laying track on their spur from Baca station, and are trying to get this work completed before the rainy season. This district has recently shown much activity, and at the present time there is much exploration work in progress.

W. F. Tye, electrical engineer for the Canada Electric Syndicate, has been looking over the Parral district, making arrangements for contracts. This company intends to put in a dam on the Conchos river at a place called San Nicholas de la Joya, and erect a plant that will develop 2,500 h.p., so as to furnish Parral and surrounding camps with electricity.——The Gran Bretaña has lately struck good ore on their 300-ft. level, which is also the water-level. They have now about 400 ft. of drift, and are driving both north and south. The vein is 6 ft. wide, and the ore is divided into two classes, one



running 1,800 gm. silver, with 40% lead, and the other giving 1,000 gm. silver, with 10 to 15% lead. They are now working 25 men, and expect to soon begin shipping, but only the ore taken out during the development of the property. C. F. Gerhardt, the superintendent, states that it is the intention to sink the shaft another 100 ft. Electric plunger sinking pumps have already been purchased, and are now on hand. This property is three miles north of Parral.

The Buen Viento is again in operation. A 15-h.p. electric hoist has been installed, and about 25 men are at work. A cross-cut from the 327-ft. level is being driven to cut the San Cristobal vein at a depth of 700 ft. This property is north of, and close to, the Palmilla.——The San Cristobal mine is now shipping a car of ore per day. The winze on the 300-ft. level to the south of the shaft, is now down 155 ft., with drifts both north and south at the 75-ft. and 125-ft. levels. This winze has been sunk entirely in a new ore-shoot, and has opened up between 6,000 and 7,000 tons of ore running about 1,000 gm. silver per ton. At the present time they are stoping at the 75-ft. level of this winze. An electric 15-h.p. hoist has been installed at this winze, and it is the intention to sink to water-level, and further develop this shoot of ore. The vein is from five to six feet wide. This mine now employs about 50 men; it is about three miles north of Parral. The Chinaca mine, owned by James E. Hyslop and associates, is now being steadily developed. This property is not far from the Azules camp in the Santa Barbara district. Work has recently been started on the Zapoteco property, owned by Hamilton and associates of Parral. This property is close to the La Perla group, about six miles north of Parral.

London.

A Stagnant Stock Market.—British Consols.—Labor Troubles on the Rand.—American Mining Shares.—Cornish Optimism.—Oroville Dredging.

Regarding the past fortnight (which includes the Whitsun holiday), the financial press is unanimous in describing the prevalent conditions in the stock market as having been mainly either a near approach to utter stagnation or more or less acute depression. Investors have continued to hold aloof, at all events as buyers; while those who have come forward as sellers have found prices slipping away persistently. Writers have not failed to notice that the price of £84 2s. 6d. touched by Consols was the lowest quotation for the premier security since 1848, and that only once since then has the price approached nearly to 84. It must be remembered, however, that the rate of interest is now only 2½%, whereas then it was 3%. But it is remarked that those were times of severe financial crises of a character quite lacking on recent occasions. It is said that a Stock Exchange man with nothing better to do, occupied himself one day in roughly collecting the views of his fellows as to the cause of the present disastrous state of affairs. This is the list of troubles he had to jot down: Closing of weak bull accounts, iniquitous income tax, radical government, socialistic propaganda, labor troubles, unrest in India, fear of gold exports to France and America, more sellers than buyers, weather, generally false markets, slump in Wall St., good trade, too many aliens in England, free trade. A more weighty observer, the head of a great banking house in Lombard St., states: "There can be no doubt that the policy of the Government has given rise to serious uneasiness, for nobody can tell what line they intend to pursue." Taking up the parable against our present political masters, a 'surveyor' quoting from his own experience, shows that the "entire investment market is suffering from a Radical frost." In these circumstances, the gloomy appearance made by the last mining making-up list is not at all surprising. As to South African shares, it is pointed out that although lower all round than at the last preceding settlement, these have suffered rather less than might have been expected; for, in addition to the doubts still entertained as to what may be the ultimate decision of the Transvaal legislature in regard to the Chinese coolies as a negative influence, there is the positive deterrent furnished by the strike movement among the white employees on the Rand. As the labor dispute has arisen over the perfectly just demand of the mining companies that highly paid white supervisors should perform a fair amount of work for their big wages, and as, moreover, the authorities have taken prompt measures to prevent terrorism and disturbance, it is probable that the strike will be of short duration, more especially as there are plenty of unemployed men only too ready to replace the strikers; but while the unsettlement lasts, good business

in Kaffirs is, of course, out of the question. At the moment of writing a more cheerful view prevails. It is significant that although some thousands of men are reported to be on strike, no case has yet occurred of a mine having to hang up its stamps from want of labor, and the news just announced by cable from Johannesburg that the engine-drivers' ballot has resulted in a decisive vote against striking is regarded as of good augury for the early termination of the trouble.

Apart from the situation in South Africa, which has no parallel in any other mining centre, it may be of interest to consider whether there may not have been conditions in some of the mines themselves, or in their managements, that have had a deterrent influence of late on would-be speculators and investors. To begin with the section of the Market in which the least disquieting elements have been noticeable, namely, American mining, may it not be said that speculation has died out in the cases of certain mines, mainly in consequence of the monotonous nature of the reports and returns coming from the other side? A steady revenue of 12, 15, or 20% may induce quiet investment on a limited scale, a state of things most proper and desirable from a certain standpoint, no doubt, but to promote speculation, which after all is the life and breath of the mining market—keeping up the interest and ever widening the circle of people that deal in mine shares—more frequent and crisply written reports are necessary, promptly recording the facts, changes, and progress observable, and intelligently noting them for their bearings on the future prospects of the mine. Probably in many cases the amount of knowledge of the mine supposed to be possessed by the officials on the spot is over-rated by the public, but rightly or wrongly speculators here feel they are left to grope in the dark while others more advantageously situated are basking in the full light of day, or in other words, making hay while the sun shines.

In connection with other mining centres, great disappointment and heavy losses have succeeded periods of inflation of prices brought about by exaggerated statements of value, or the prematurely assumed success of some new method or process. On the strength of a big price for the metal, a Cornish tin mining 'boom' was promised, but while a small number of old established mines have done fairly well by being able to sell their outputs at larger figures, most of the operating companies' shares can be bought today at below par value. It is beginning to be recognized that the mines of long standing require much overhauling and renovating of plant and machinery, to say nothing of a more liberal plan of development, before full advantage can be taken of the favorable conditions of the metal market. On the other hand it is found that the old abandoned mines, which were to be reopened with "vertical shafts and levels driven straight to the lode" by the waving of the magic wand of "modern appliances" will require very cautious handling and the employment of much time and money before their 'houses' of long accumulated water cease to be an obstacle to the workers and their 'courses of tin' can be found and profitably worked.

Oroville Dredging has declared a seventh quarterly dividend of 12½ cents per share payable on June 29 to shareholders of record on May 29. The gross yield to May 13 is reported as $1,406,657. Allowing for the estimated yield for the remaining 11 weeks to July 31, the total yardage for the two financial years is brought up to 12,000,000 cu. yd. with a net profit of $800,000, after providing a reserve for depreciation of plant, machinery, &c. Deducting dividends from this at 10% per annum for the period in question, there is an estimated net surplus of $180,000.

Mexico City.

Sale of the Palmilla.—Blaisdell at Pachuca.—Placeres del Oro.—Gardemo Co.—Zapote District.

Bert Peterson has about closed a contract to take the noted Palmilla mine, belonging to Pedro Alvarado, at Santa Barbara. It is said that Mr. Peterson will build a mill and cyanide plant, operate the mine and mill, and assume the indebtedness of Don Pedro for a percentage of the net profits. This mine is estimated to have produced $3,000,000, and still has large quantities of ore available. About $85,000 of ore is now being shipped from the mine. Water is giving much trouble.—— H. W. Blaisdell has purchased a large accumulation of tailing at Pachuca. A metallurgist of Parral carefully measured and tested the pile and found 524,000 metric tons available, carrying 138 gm. silver and 3.1 gm. gold per ton. This is equivalent to about 10 *pesos*, from which an extraction of 75% was obtained. Mr. Blaisdell, therefore, has a good proposition.——The Oxnam Prospecting Co. has ordered stamps to supplement its dry-crushing mill and cyanide plant. Part of the mill is to come from Milwaukee to Temosachic by express, in order to reach Guazapares before the rains commence.—— The new mill of the Veta Colorada Mining & Smelter Co. at Minas Nuevas will consist of 80 stamps, 9 tube-mills (the entire mill product being ground fine) and some filter for washing all the tailing. This is a change from the first plans, which provided for sand and slime treatment, using Blaisdell machinery. It is reported that Grothe's (Pachuca) method of air-agitation for the pulp will be used.

Some recent discoveries of gold and uranium have drawn attention to the Placeres del Oro district, in Guerrero. As the name indicates, there are gold placer deposits in the district, and from time to time they have been examined by experts, and many glowing reports of the immense richness of the field have been published. Two years ago an investigation was made by the Rio del Oro Exploration Co. under a concession from the Mexican Government, and it was found that the average value of the gravel, including overburden, was 15c. per cu. yd., the average depth to bedrock being 2½ metres. There is an abundance of water, but the fall is less than one per cent. In the main river, boulders would interfere with dredging, but there are many flats, covering hundreds of acres, that are free from boulders, and the bedrock being a soft diorite, the conditions are favorable to dredging. This company has been exploiting a number of gold veins, which are showing up well. One ot these, the La Lucha, has a large body of low-grade ore, in which occur shoots that are rich in gold, 200 kilo. having been taken out that averaged over $20,000 per ton. In all some $7,000 have been produced since last September. Some of the ore was shipped to Mexico at an expense of $100 per ton, for freight, and a lot of it was treated in *arrastres*. At present their Elnita mine is being worked; the ore is shipped by burros to the Gardemo Co.'s mill at Milpa Chica, about eight miles distant. Over 50 tons have been milled and 900 gm. of gold have been cleaned up from the plates, besides the concentrate. The ore averages about 38 gm. gold per ton.

The Gardemo Co. has sunk the main shaft of the Piuzan mine to 100 metres and is cross-cutting to the vein, which will be reached in a few weeks. From the 60 m. to the 80-m. level over $100,000 worth of ore was produced in the past two years, and it is expected that the present development will show double that amount.

Salt Lake, Utah.

Shipments From Tintic.—Arresting Fume.—Solution of Smoke Question. — Consolidation at Bingham.—The Cactus Dividend. — Other Dividends.—News From Park City.

Ore shipments from the Tintic district last week amounted to 153 carloads, the contributing mines and respective amounts being: Ajax, 3; Bullion Beck, 3; Beck Tunnel, 8; Bullock, 1; Carisa, 5; Centennial Eureka, 57; Colorado, 6; DePue, 6; Eagle & Blue Bell, 4; Eureka Hill, 9; Grand Central, 6; Gemini, 5; Lower Mammoth, 8; LaClede, 1; May Day, 4; Mammoth, 10; Scranton, 6; Uncle Sam, 4; Victoria, 3; Yankee Con., 4 carloads.

The new bag-house system of the United States Smelting, Refining & Mining Co., installed at the Bingham Junction smelter of that corporation at a cost of $100,000, is in successful operation and the management has expressed the confidence that so far as the United States company is concerned, further serious difficulty over the smoke question is at an end. In explanation of the mechanism of the plant H. A. Prosser, the manager, has given out the following: "It consists of a substancial brick building 192 ft. long, 58 ft. wide, and 60 ft. high. It contains 2,080 bags, each bag being 32 ft. 6 in. long and 18 in. diameter.

The smoke from the lead blast-furnaces is sucked out of the flue by a fan and forced into the bag-house. About 12 ft. above the ground-level there is a steel floor covering the entire space between the walls. In this floor, at regular intervals, about two feet apart, holes are cut 18 in. diam. A pipe, 18 in. diam. and 6 in. long extends upward from each hole. The bags, which are of cotton, are slipped over the end of this pipe and tied with wire. The upper end of the bag is then supported from the roof. The smoke, entering underneath the steel floor, passes up through the numerous openings in the bags and cannot get into the upper part of the bag-house without passing through the cotton fabric, which takes out the solid matter and soot so that the gas leaving the bag-house is as clear as air. The fan pumping the gas into the bag-house is driven by an electric motor, which receives power from a special General Electric 750-h.p. steam-turbine in the power-house. In case this steam-turbine should be shut down for repairs, the power to run the motor can be furnished from another dynamo. It is thus possible to keep the bag-house in operation continuously and there is no chance that a shut-down in the power-house would stop the operation of the bag-house."

The articles of incorporation of the Bingham Central Standard Copper Co. have been prepared and will be filed during the coming week. This company is a result of the coalition of the Bingham Central and Bingham Standard mines at Bingham. The new organization will be capitalized for 1,000,000 shares of $5. Out of this number, 400,000 shares are to go to the shareholders of the Central and an equal number to those of the Standard; the balance, or 200,000 shares, will be left in the treasury for future disposition. Samuel Newhouse is to be president of the organization.

Samuel Newhouse made an inspection of the Cactus copper mine in Beaver county last week and has reported cheerfully; while the directors of the company will meet in New York about July 1, the initial dividend will not be paid until September. The mill is treating an average of 800 tons per day, but as soon as the crushing equipment ordered some time ago is installed, the capacity will be raised to 1,200 tons.—— The old Dyer copper mine in Uintah county has passed into the possession of John C. Gates, of Milwaukee, who is taking steps to operate it again. The mine is equipped with a small smelter and has produced considerable copper in the past. The copper deposit occurs in sandstone and mining was carried on formerly by the quarrying system.

The case of the Grand Central Mining Co. *v.* Mammoth Mining Co., is being tried in the District Court at Nephi this week. These companies have been litigating for several years. The defense lost in two former trials and the judgment of the lower court was affirmed in the Supreme Court of the State. The question now up for settlement is that of determining the amount of damages to which the plaintiff is entitled. The question of apex rights was involved. The Grand Central and Mammoth are two of the principal mines in the Tintic district.

Dividends have been posted for payment on the 20th inst., by the following mining companies at Tintic: Grand Central, $10,000; Colorado, $40,000; Beck Tunnel Consolidated, $40,000; Lower Mammoth, $9,500. The Fish Springs district is represented by the Utah mine, which pays $3,000 monthly.——The management of the New Stockton Mining Co., at Stockton, is taking steps to enlarge the mill on that property. The present plant is treating about 75 tons per day and the capacity of the plant is to be doubled.

Ore extraction has been suspended by the Ontario Mining Co., at Park City. The management has decided to unwater the mine by means of large pumps before resuming the task of re-opening the drainage adit, which has been closed for more than two years. Work in the adit could be undertaken now only at great hazard.

Butte, Montana.

Failure of Butte Exploration Co.— A Dividend.— The Butte & Bacorn.—Original Consolidated.—Report of Butte Coalition.

The failure of the Butte Copper Exploration Co., and the discovery of the stockholders that the company owned nothing except some equipment at the Six O'Clock mine, and a lease and bond on the property, has had a bad effect on some of the other new companies, and some meritorious enterprises will probably find difficulty in raising money with which to continue work. Hereafter, speculators will probably make inquiries as to the assets of the companies offering stock for sale, and many have already started to investigate other companies operating in Butte. There are a number of the new concerns that are selling stock, and have nothing but short leases and options. Other companies own their ground. Among them are the Butte & London, Amazon-Butte, Butte & Bacorn, East Butte, Bullwhacker, Butte Continental, Tuolumne, Butte & Superior, Pilot Butte, while other new companies, like the Butte-Milwaukee, Butte Copper, Butte New York, and Butte Copper Montana own a portion of their properties outright, have interests in others, and options on some. All these companies are making good progress in development work.

The Bullwhacker Copper Co. has declared its first dividend, and will distribute $10,000 on July 1. The company is capitalized for $1,000,000. The dividend is paid out of royalties.

The Butte & Bacorn Co. is now concentrating its work on the Calumet, and is making rapid progress in shaft-sinking. The shaft of the Calumet is about 1,000 ft. deep, and as soon as a sump is completed a station will be cut, and then cross-cuts will be run north and south. Sinking on the Belinda and Colleen Bawn has been suspended. The former is down 810 ft. and the latter 300 ft. The sinking record of the Calumet during four months was 435 ft., 110 ft. of which was sunk in May. The cross-cut north from the shaft will come under the

Belinda shaft, and connection will be made from the cross-cut. Extensive surface improvements are under way on the Calumet. A new 100-h.p. boiler and a larger head-frame are being placed. The company has also ordered a new first-motion hoisting engine capable of working to a depth of 1,500 ft.—— The Alliance Copper Co. is now driving east and west on the vein at 300 ft., and is opening good copper ore. In the west drift nine feet of commercial ore has been exposed, while the east drift has a foot and a half of copper pyrite.—— The Farrell Co., which is working its ground through the Alliance shaft, is still extending a cross-cut on the 200. A small vein of copper ore was cut a week ago, but the vein will not be reached for some time yet.

The Original Consolidated Mining Co., W. A. Clark's only mining company in Butte, has made an annual statement, showing net earnings during the year ending June 1 of $663,259, which is about $15,000 more than the preceding year. The company operates the Original and Stewart mines, both small fractions. The statement gives the following details of operations: Tons of ore extracted, 264,431; gross yield per ton, $9.31; cost of extraction per ton, $4.08; total cost of extraction, $1,080,868; cost of transportation, $57,479; cost of reduction per ton, $2.49; total cost of reduction, $660,244; cost of labor, $731,772; paid for machinery and supplies, $349,096; net proceeds, $663,259.

The first annual report of the Butte Coalition Mining Co., or rather the report covering the 10½ months of its operation in 1906, gives an idea of the future possibilities of the Coalition mines. It also shows some extraordinary accomplishments under the management of Arthur C. Carson, who has had charge of all work since the Coalition Co. took over the Heinze mines. The properties were in a very bad condition when Mr. Carson took charge of them, yet, while carrying through an immense amount of rehabilitation, he mined a total of 336,420 tons of ore during the 10½ months, yielding 75.86 lb. copper, and 2,216 oz. silver per ton, making a total of 24,995,112 lb. fine copper, 730,225.83 oz. silver, and 1,500 oz. gold. Few companies in Butte mine better ore than that, probably the North Butte alone exceeding it in the value of copper, the average being nearly 4%. The company has a three-year contract with the Washoe smelter on a basis more satisfactory and profitable than if it treated its own ore. The mines are operated through a mining company called the Red Metal, all of whose stock is owned by the Coalition Co. The president, T. F. Cole, says: "At the time of the acquisition of the Red Metal Mining Co.'s mines it was deemed advisable to sink its shafts to much greater depth, to drive cross-cuts through undeveloped territory, to extend drifts on ore-bodies found on many of the existing levels, as well as the additional levels to be developed upon completion of shaft sinking; to sink a new shaft on the Tramway claim, with connections on several levels to afford permanent and safe outlet for our men, and provide facilities for the increased tonnage of ores our extra development work would make available; to sink a new shaft to provide ventilation in the Rarus, thereby improving the conditions of that mine for our employees. This company intended to loan to the Red Metal Co. up to $1,000,000 or more if necessary to pay for this extraordinary development work and additional hoisting, pumping, and tramming machinery to properly equip the mines for larger output and economical operation. Owing to the better value received for our metal, and increased values in new ore developed, the loan has not been made, and the Red Metal Co. has accomplished nearly all the work planned and paid dividends of $800,000 out of net earnings, and accumulated a considerable surplus."

Denver, Colorado.

Mining Litigation at Cripple Creek.—Water-power Development.—State Geological Survey.—Measurement of Industrial Temperatures.

The suit of the Portland Gold Mining Co. against the Stratton's Independence Co. and seven of its lessees to recover approximately a half million dollars worth of ore, said to have been extracted from the ground of the Portland company by the lessees mentioned, has so far gone against the Portland company. The presiding justice has dismissed the suit for trespass, on the ground that no trespass has been proved. Pending the institution of a new suit, he has granted an injunction to prevent the lessees of the Independence working in the disputed territory. In all probability the Independence will procure an injunction to prevent the Portland also from working in the disputed ground. It is regrettable that the operation of two such prominent companies should be hampered by this unfortunate litigation, the more so as the past history of both has involved a good deal of similar litigation, which has been at once a source of expense and of annoyance, and a hindrance to actual mining.

The rapidly increasing development of the water-power of the State is one of the most important phases of its development. The largest company operating in this way is the Central Colorado Power Co., which recently attracted attention by the execution of a mortgage for $20,000,000 to the Knickerbocker Trust Co. of New York. The mortgage is secured by the properties of the company, among which are the DeRemer canal and pipe-line, near Glenwood Springs; the Grand River Power & Transmission Co., above Glenwood Springs; the Hine reservoir, on the Williams river, in Grand county; the Hine reservoir No. 2, near Grand lake; the Aspen reservoir No. 1, in Pitkin county; and the New Century reservoir, in Gore cañon. The water-power available at these points is to be developed and transmitted to Leadville, Cripple Creek, Denver, Colorado Springs, and Pueblo. Curtis & Hine of Colorado Springs have been the originators of these various enterprises, and have called to their aid the services of some of the best hydro-electric experts in the United States.

Important work upon the geology of the State is planned by the State Geological Survey. Under the direction of R. D. George, the State Geologist, parties are to study geological problems in Routt, Grand, and Summit, and possibly in Custer and Eagle, counties. The beginning of systematic and organized work is gratifying. No less important is the preparation of a bibliography of all that is known concerning the geology of Colorado, and a compilation of the maps of the State.

The measuring and recording of the temperatures of various industrial operations has, in the last year or two, attained an importance of the first rank. In all operations in which heat is employed there is always some one point at which the purpose of the operation is best served, and the degree of accuracy of securing and maintaining this is a measure of the efficiency and economy of the process. With the demand for apparatus for this purpose has come the supply, so that it is now possible to secure cheap and efficient means for obtaining a continuous record of the temperature employed in any industrial operation. The appreciation of the advantage of this is seen in the almost universal use of pyrometric apparatus in zinc plants, and many smelters are also employing pyrometers to record the temperatures in roasters and blast-furnaces. Not the least gain from their use is in uniformity of operation, for the workman soon learns that neglect to fire up, or to feed the furnace

at the proper time, is unerringly recorded by the instrument in the superintendent's office, with a resulting gain in strict attention to his work.

Johannesburg, Transvaal.

Gold Production.—Labor Troubles.—Contractors' Strike.—Serious Condition of Affairs.—High Wages.—Actual Figures.—Need of Reform.

The gold output of the Transvaal for April has been declared at 537,019 oz., valued at £2,281,110. Of this total, the Rand's contribution was 518,243 oz., valued at £2,201,354. During the past month there were 8,530 stamps at work in the Transvaal, 8,185 being on the Rand. A duty of 8.38 tons per stamp per 24 hours is recorded by the Luipaard's Vlei Estate mine. The lowest stamp-duty is that of the Windsor mine, namely 3.6 tons.

Just now we are in the midst of the most serious strike known in the history of the Rand. There have been small disputes on individual mines in the past, but never such an extensive strike as now exists. For a long time it has been customary to place a white miner in charge of two rock-drills, there being five or six coolies or Kaffirs to do the work. On a few mines, where the conditions are favorable, the management induced some of the men to superintend three machines. There was a lot of grumbling over this at the time, but the men finally agreed to take on the other machine. About a week ago the management at the Knights Deep mine decided to reduce the price paid for contract stoping from 70 to 60 shillings per square fathom, at the same time requesting the contractor to take on a third machine. By the new arrangement the men were required to do a bit more superintending, but they could make the same money. It was high time to do something on this mine, for the wages paid to the underground contractors were absurdly high. A statement has been published, showing that the average pay of men in stopes, during the month, was over £2 per shift of eight hours, while some of the contractors made as much as £1 per shift. The men rebelled at the proposal to run three machines, and as the management was obdurate, the men went on strike. Of course they did not want to see others fill their places, so there was some disturbance. With the help of the police the management got other men into the mines, and although greatly handicapped, the mine was kept going. The men were forced to vacate their rooms on the property, and went elsewhere to spread the trouble.

By the help of the Miners' Union, and a number of labor agitators, the disaffected Knights Deep men have succeeded in working up quite a strike. The cry, "No Three Machines," was carried from mine to mine, and so persistent have the strikers been that today ten of the mines of the Central Rand are officially on strike. On some of these mines three machines have never been suggested, but the men have come out through sympathy, so the strikers say, but the press asserts that it is through intimidation. Some amusement has been caused by the men of the Village Deep mine. A delegation visited this mine, and it was arranged to strike next morning. But the general manager and mine manager made such persuasive speeches next morning that the men went back to work. The strikers were furious and sent another delegation, and once more it was arranged for the Village Deep men to stop work. But again the eloquence of the management prevailed, and the men went back to work. Then a crowd of five or six hundred strikers marched to the Village Deep, and really prohibited the men from going on shift. The last news from this mine is that the miners are determined to continue at work, and are proposing to get up an anti-strike campaign.

Although the strikers have had considerable success, they have had several severe reverses, and it looks as if the bottom were knocked out of the movement. Realizing the desperate position they will be in, should the strike fizzle out, the strikers are making frantic efforts to carry the war further. The campaign on the Central Rand has not proved altogether successful, so the strikers are planning a campaign against the East Rand. A large percentage of the men who have struck will be permanently out of employment, for in many cases their jobs have been filled, and the companies affected would far rather have an inferior man than take back a man who left work without cause. The surest way to get into work again is to stir up trouble on other mines, and when the men have struck to slip into their positions.

Another grievance of the strikers is the fact that they are asked to 'boss' more than 25 or 30 Kaffirs or coolies. The white men consider that 25 is the proper number of unskilled laborers to look after. They are trying to dictate to the mining companies what the number should be.

The men on strike are trying the impossible. Not only are they striving to limit the white man's output (the old trades union idea), but they are demanding the highest pay in the world for this minimum work. That the strike will end disastrously for the men, and that they will curse themselves for this stand later on, there seems no doubt. The strike has thrown such a flood of light on the work done by the underground contractor, and the pay he receives, that it has come as a revelation to the public. On the Knights Deep, where the strike started, the miners have drawn high pay, as shown by the following official statement, which gives the rates paid per man per 8-hour shift during March:

Map of South Africa.

	£	s.	d.
Development—Average	2	9	10
Lowest	1	0	0
Highest	4	1	4
Hand-stoping—Average	1	19	3
Lowest	1	0	0
Highest	3	0	0
Machine-stoping—Average	2	4	10
Lowest	0	18	10
Highest	4	2	11

According to these figures it was about time for the Knights Deep management to do something to bring down the costs. When one remembers that assayers and surveyors receive about £37 10s. per month, that the mine captain gets about £50, it seems highly unjust that the common miners, many of whom cannot write their names, should receive such ridiculously high wages. And this big pay does them no good. It is high time for reform.

Concentrates.

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

DIRECT contact of platinum with burning charcoal should be avoided, since the silicon reduced from the charcoal ash unites with platinum, making it brittle and liable to fracture.

IN THE concrete foundations of machinery subject to vibration, such as, more particularly, steam-hammers, large gas-engines, turbines, dynamos, and quick-revolution engines, it is necessary to provide a large mass in order to absorb the vibrations.

BESSEMER PIG IRON contains so little phosphorus and sulphur that it can be used by itself for conversion into steel by the original or acid bessemer process. In America this term is restricted to pig iron containing not more than 0.1% of phosphorus.

SUSPENSION BUNKERS, for coal or ore, are made by suspending a steel plate or framework from two side girders, the weight of the filling causing the sides to assume the curve of the equilibrium polygon; the stresses in the plates of a true suspension bunker for a full load are pure tensile stresses.

COPPER may be readily distilled in the electric furnace. When the fumes are condensed on a cold substance, a filiform felting of copper is obtained which has all the properties of ordinary copper. At boiling point, copper dissolves graphite, and releases it in a more or less crystallized form in cooling.

IN 1905 the production of crude barytes in the United States amounted to 48,235 short tons, valued at $148,803 at the mines. This represents the crude barytes after being taken out and hand-cobbed, ready for shipment to the mill. The average price per ton of the 1905 production was $3.08. The producing States were Missouri, Tennessee, Virginia, North Carolina, and Kentucky, given in the order of their rank as producers.

COMMON PRACTICE in collecting the slimes from the zinc-box is to run fresh water through the extractors until the effluent is no longer decidedly alkaline. The zinc shavings in the upper compartment are then rubbed between the fingers to disentangle the slimes, which settle to the bottom of the compartment. The tray is then removed and the liquor and gold slimes are pumped out by a special filter-press or the plug of the compartment is drawn and the gold slimes flow into the launder.

OVER-LIMED CEMENTS are unsound, and, in time, concrete made from them will disintegrate and crumble or crack. Cements which are high in lime without being unsound are very slow setting but harden rapidly, sometimes reaching their maximum strength in as short a period as seven days. Such cements, when subjected to tension tests, usually show retrogression as the test pieces grow older, but, when subjected to compression tests, show an increase of strength with age. High lime cements become very brittle on hardening, hence when they are tested in the ordinary manner more or less distortion is met with, owing to the shortness of the test piece, and the briquette is snapped off, and not pulled apart.

FEW mineral substances are as widely diffused through nature as arsenic. And yet there are comparatively few arsenic-bearing deposit which are so favorably situated as to guarantee their successful commercial development. Some of the more important sources of arsenic are the silver ores mined in Saxony, the tin and pyritic ores found in England, the arsenopyrite or mispickel produced in Spain, and the gold-bearing mispickel and nickel-cobalt-silver ores of Ontario. Native metallic arsenic is found occasionally, especially in association with antimony, ruby silver, and some other ores. Among the countries endowed with good deposits of arsenic are Germany, Great Britain, Austria-Hungary, France, Italy, Spain, Portugal, Norway, Siberia, New Zealand, Chile, Mexico, Canada, and the United States.

AN extraction of about 97% is said to be obtained at the Snowstorm mill at Larson, Idaho, where a copper carbonate ore is being treated. After crushing, the ore is run into agitators, where it is mixed with a 10% solution of sulphuric acid and a solution of chloride of lime. Thus a solution of copper sulphate is formed, while the silver remains as a precipitate of chloride. From these agitators, which are three in number, the copper sulphate solution goes through a series of six settling vats. From the solution, the copper is precipitated with scrap iron, and the residnes containing the silver chloride are treated with sodinm thiosulphate. The solution of silver thiosulphate thus obtained is passed through settling vats and the silver is precipitated from the clear solution by sodium sulphide, the precipitate being filtered and shipped for refinement. The ore runs from 2½ to 3½% copper and about 7 oz. silver.

A PECULIAR occurrence of cobalt and nickel with gold was discovered in 1905 on Rabbit Lake, east of Temagami and about 30 miles south of Cobalt station, in Ontario. The rocks there appear to belong to the Lower Huronian conglomerate-graywacke series. The orebody, about 18 in. wide, was in a zone of fracture. Through the chlorite schist was a reddish felsitic material, which under the microscope was seen to belong to the fragmental series. Veinlets and impregnations of a gray cobalt nickel ore occurred sparingly in both the chloritic and felsitic material. An analysis of some of the more highly mineralized material gave the following results: Arsenic, 22.5%; cobalt, 8.7%; nickel, 6.5%; gold, $8.80 per ton; silver, $1.10 per ton. The Rabbit Lake occurrence is about the same distance south of Cobalt station as those of the township of Ingram are north of it, thus showing that the cobalt-nickel ores are distributed over a distance of at least 60 miles in a north and south direction.

STIBNITE, the sulphide of antimony and the chief source of the metal, is widely distributed in the United States, Europe, and Asia. When pure this ore, Sb_2S_3, also called needle antimony and glance, in the trade, contains 71.2% antimony, and 28.2% sulphur. It is shiny steel gray in color and soft. The oxidized ore, Sb_2O_3, a dense, heavy, white mineral occurring in plenty, is of comparatively lower grade and more complex than stibnite. Senarmontite, or oxide of antimony, usually contains from 30 to 65% of the metal as mined for consumption, but the difficulty experienced in treatment has discouraged the demand. Another common ore is kermesite, or red antimony, a mixture of oxide and sulphide, which is mined principally in Italy. Antimonial ochers, found largely in Algeria, Asia Minor, and Borneo, are of some value as a source of the metal. Antimonial lead, produced in quantity by leading refining works, is an important contributor to the supply of antimony.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy.

The Meaning of Striations.

The Editor:

Sir—In your issue of April 6, a letter by Mr. Horace W. Bucke describing a few geological conditions calls for some amplification of his discussion. Recognition of the fundamental position of geology to mining is rapidly spreading, and it devolves upon the mining geologist to do his best to keep clear the true relations of the science to the art.

Every ore formation owes its genesis to two sets of conditions, physical and chemical. Of the physical conditions the most essential, in the sense of being necessary first to be present, are the structural features in the rocks. At any place one set of conditions may be right for the deposition of ore, yet no ore will be present because some or all of the other conditions are lacking. In many mines are found fault-fissures with considerable open space, yet not containing an ounce of ore. Striations are of themselves nothing more than simple records of rock movement, or faulting; they come under the category of physical conditions. It is only when possible watercourses along fault-planes are seized upon by chemical waters from above or below that striations become of value in deciphering the character of ore-shoots. And here we come sharply against a fact that does not receive sufficient emphasis. There is no necessary simple relation between the situations on the walls of a fault, or vein filling a fault-fissure, and the relative position of the walls. The actual position of the walls is due to a number — seldom one — of separate movements. Often the striations are curved. The vital point is that the striations mark merely the direction of the last motion at the particular place where found. In a certain mine in the Inyo range, where the faulting is extremely complex, a strong north-south fault was characterized by great horizontal movement at first, followed later by vertical motion. Both sets of striations are preserved. Ore deposits along the fault were later than the first slipping, and earlier than the last. A third set of movements was vertical, with resultant striations on the ore. Thus in many orebodies faulting has occurred before, during, and after the deposition of minerals, rendering the study of the conditions difficult. Hence it may be stated here (for a full discussion is out of place), that the striations on the walls of mineral veins are but one of *many* conditions to be used in determining the position of orebodies. There are many cases in which simple relations obtain between the striations and ore-shoots, but it is productive only of error to generalize from the simplest facts alone.

Regarding 'laws' of enrichment of orebodies, it is necessary to remark that as yet the laws of mineral deposits can be only of the most general character. A fast-growing science like economic geology is busy gathering new facts; it is not arranging, except tentatively, known facts into laws.

The few facts cited by Mr. Bucke are altogether inadequate for the basis of an opinion on possible or probable orebodies, though probably a determination of all the facts would furnish sufficient ground for exact statements. From what was given in the letter about calcite, it would seem that this mineral is the result of a later period of circulating mineral waters, which possibly have caused (by secondary concentration) the irregular value of the vein. The vein is cut by a diorite dike and it is this intrusive that has probably set in motion the calcareous waters. Calcite veins accompanying dioritic intrusions are not uncommon, but of itself the calcite in this part of the world is usually lean. The gold veins of the Mother Lode are characterized by carbonates, but ores most heavily charged with calcite, dolomite, and ankerite, are lowest in value. In one mine near Angels Camp, calcite veins have been enriched by silicious solutions carrying gold. The pure carbonate carries little value, and rich rock occurs only where quartz is present. In the Empire mine at Grass Valley, the vein on the 2,000-ft. level, typical of the area, shows 3 to 4 ft. of rich quartz on the foot-wall, and about 4 ft. of wall-rock thoroughly impregnated with calcite on the hanging. The quartz carries only traces of gold. However, there is no reason, given the necessary physical conditions, why calcareous waters cannot act to cause secondary enrichment of pre-existing veins. For instance, such action is progressing on the Comstock, where the big bonanzas themselves were probably due to secondary enrichment by solution and re-deposition. Again the facts stated by Mr. Bucke are far too few. Too much must not be asked of geology.

The Mine Boarding House.

The Editor:

Sir—Mr. Alderson, in one of his valuable 'Letters of a Self-Made Miner to his New Foreman,' touches upon a subject that seems to me worthy of more extended consideration than he gives to it, namely the feeding of men employed in a mine. In mining camps where there are various boarding-houses not connected with the mines, the matter takes care of itself, and it is generally true that such boarding-houses furnish excellent food because the miners receive good pay and will refuse poor food. It happens frequently however, that the mine is isolated and the company is obliged to maintain a 'company boarding-house,' which is usually a source of constant annoyance to the superintendent, and too often is unpopular with the men. Years of experience in charge of mines where boarding-houses have been necessary, have confirmed me in the belief that under such circumstances the only satisfactory plan is to consider the boarding-house a mutual affair. The company furnishes the boarding-house in order to carry on its work; the men pay for their board simply to get food; neither should attempt nor expect to make any profit at the expense of the other. A boarding-house properly conducted should charge sufficient to allow for a well-furnished table without loss, and no more. The rate charged belongs to the table and the men, and not to the mine.

Mr. Alderson writes to his foreman: "Your men must be well fed." This is quite true, and he might have added that without feeding them well it is impossible to keep good men; they don't have to stay. As a business policy the reputation of a good boarding-house is worth more than it costs simply by attracting good men; it attracts worthless men too, but these can be weeded out and a good crew secured and held. Any man who gets up from a table well satisfied with his meal is easily worth twice as much in a mine, between meals, as the man who leaves the table dissatisfied and angry because he feels that the company is trying to make a profit from his food. Buying low-grade food for the boarding-house table is the exact reverse of the very good policy of buying high-grade oil to save friction in machinery. At the end of the year a company's books may show a few hundred dollars profit from the boarding-house, but if

the real truth were known it would disclose a much larger resulting loss in the mine.

The Rand Labor Strikes.

The Editor:

Sir—From the recent cabled information from the Rand, it is evident that the true issues as between the employer and the employee in these Rand labor strikes, are not only in danger of being obscured, but are also very little understood at all on this side of the water. Quite recently I visited many of the most important of the gold mines at Johannesburg, and in going through the underground workings, I made it my special object to draw out from the miners themselves, the mine managers, and all others interested in the question, all their various views on the main question upon which these strikes are based, that is, the employment of more than two machine-drills by each miner.

I must first explain that the miner on the Rand occupies a distinctly different position to miners in any other part of the world, for the simple reason that he, more properly speaking, is himself an employer of labor, as a petty contractor. In this position he contracts with the company for it to provide him with one, two, or more machine-drills and the power, in the form of compressed air, to operate these drills.

In order to assist him in the strenuous work of setting up these heavy drills in such a position as to do their work most effectively, which is to break down the maximum amount of rock when these holes are finally blasted with dynamite, this miner-contractor employs three or four Kaffirs or Chinese coolies to assist him. After the drill has been fairly started, the actual working of it can easily be entrusted to the more intelligent of these Kaffir and Chinese assistants, and the miner himself can then retire into some convenient place, where he can rest, smoke his pipe, eat his lunch, and listen to the steady tap tap of the drill. Should any breakdown occur, or the drill get jammed, the miner, hearing the tapping noise cease, goes down to ascertain the cause, which is usually righted by the use of a spanner and the aid of a little hard language, mainly a mixture of Cornish, Kaffir, and Dutch swear words.

An intelligent contractor, with two machine-drills, can easily make £50 or even £100 per month, his cost of living, as a bachelor, being covered by £12 per month, or as a married man, £25 to £30. It is evident that he is making far larger profit on his labor, than not only any other of the miners who may be on day's pay at the rate of 15 or 20 shillings, but also any of the other skilled laborers, such as engine-men or mechanics. There is no dispute, and there certainly is no reason for any dispute, between the employers and any other portion of the skilled laborers, all of whom are getting reasonably paid, and are doing far better than similar men in other parts of the world, as the cost of living has, during recent years, been materially reduced, and the companies house their men for merely nominal rentals; so that in these respects, those employed in the mines are in a far better position than the poor residents of Johannesburg, who, as a rule, depend for their livelihood largely upon share-market operations, which, of late, have been practically nonexistent, or on the losing side. It will be noted that these contractor-miners are insisting that great damage is done to their health owing to the fine dust made by the machine-drills.

This argument is, to some extent, correct, when applied to the miners who are on development work. Miners, working under these conditions, certainly suffer from dust and deserve to be considered in quite a different category to the far larger majority of men, who are breaking down the rock in stopes, for, under these conditions, not only can the miner easily work two drills, but sometimes three, and occasionally even four machine-drills. As only a limited number of competent miners are permitted by the Union to do this contract work, it is easily understood why they object to look after more than two drills, as there would not be sufficient work to go around for them all; the work is therefore practically kept in a closed ring and those who learn machine-drill work and might easily make as 'big money,' are not allowed by the Union to come within the charmed circle. No better time for such a strike could possibly be chosen for the employer of labor on the Rand, and no worse for this ring of union miners, as, on one side, the employers say that very shortly they must shut down their mines altogether, with the exception of the rich dividend-payers, that is, if the Chinese coolies are removed before an intelligent substitute has been found for them, and on the other hand, in a few short months, a large number of those now unemployed, among the English and Dutch, could be taught sufficiently how to operate machine-drills as to permit of their taking the place of these petty contractors, who now so foolishly stick out for totally unreasonable terms of payment.

Judged from a share-market standpoint, for my own part, I would take these Rand labor strikes as a bull rather than as a bear point, as most certainly they will finally result in favor of the employer and reduced costs of working, and consequently larger profits to shareholders in mines that in most cases are paying little or nothing at the present time.

EDGAR P. RATHBONE.

London, May 24.

SALT IN MEXICO.—The manner of extracting the salt from the many shallow lagoons along the coast in the vicinity of Manzanillo is primitive and simple. At a convenient place, generally at high-water mark, the following is constructed: On top of four strong posts, placed upright and protruding out of the ground about six feet, a flat covering is built of poles; on top of these about a three-foot thickness of dry grass or straw is placed. When completed it is a flat-roofed shed, with straw covering. This is to serve as the filter. Underneath this a receiving bowl is made of stone and lime mortar. At one side of the filter and bowl the evaporating pans are made of lime mortar, being shallow tanks not over six inches deep and divided into squares of about 150 superficial feet each. This completes the salt works. A layer of earth one-fourth to one-half inch thick is then scraped daily from the exposed land that was covered with water when the lagoon was full in the wet season. This earth is carried in baskets on men's heads to the top of the filter and emptied onto the straw roof. Water is then filtered through the earth and straw, and falls into the receiving bowl highly charged with salt. The liquid is passed to the evaporating pans, this being done with earthen jars. The sun evaporates the water and leaves the pure salt, which is piled up in the sun to dry. It is then packed in bags and conveyed by mules to the market. The cost of making this salt is about $3.50 per ton, and it sells for at least twice that much, even when the prices are lowest. It is considered the best of the Republic, and commands the highest price. About 15,000 tons are now produced each year during the three months' season. With machinery much more could be made, and no doubt at much less cost. There is a ready market for many times the quantity now produced.

The Filtration of Slime by the Butters Method.

Written for the MINING AND SCIENTIFIC PRESS
By E. M. HAMILTON.

As the Butters patent filter has now been in operation for nearly three years, it may fairly be considered a practical success, and the aim of the present paper is to give a detailed description of its inception, construction, and method of working, in the hope that it may prove of general interest to the mining community.

The need of a filter of some sort was first forcibly presented to the minds of Charles Butters and his associates at their works in Virginia City, Nevada. The tailing being cyanided there was originally derived from the Comstock mills, but it has been treated and re-treated several times by the pan-amalgamation process, and as it stands today in the dams it contains about 75% of material that is unleachable, and which may therefore be designated as 'slime.' And this slime is of an exceptional character. In addition to difficulties connected with solution of the gold and silver contents, which it is not proposed to touch upon in this paper, the mechanical condition of it is such that it gives trouble in settlement for decantation. The clarification produced by a coagulent such as lime is perfect, but the subsidence is so slow that the amount of solution recoverable in this way is not enough to make the decantation process a practical success. A 70-ton charge, with a 4 to 1 dilution, will in 24 hours not settle to less than 3 parts by weight of solution to 1 of slime, and the thickest pulp obtainable by two or three days' settlement in the deep vats will still contain about 2 of solution to 1 of slime.

A curious point about it is that even after being washed in many changes of clean water to remove all soluble salts, it will still settle in a medium of distilled water more rapidly and compactly than in any solution hitherto tried, whether acid or alkaline. When lime, however, is added to the pulp the mixture seems to coagulate into a gelatinous curd, and the slime loses to a large extent its power to separate out by gravity.

Here are displayed in a marked manner the phenomena mentioned by Julian and Smart in 'Cyaniding Gold and Silver Ores,' namely, that coagulation is not necessarily accompanied by good settlement, and that under certain circumstances excessive coagulation is positively injurious. In one instance a sample of slime, from which most of the fine silica had been removed by careful separation, was diluted in the proportion of 4 of water to 1 of slime, and sufficient lime added to neutralize the charge and leave about 0.05% of free alkali in solution; this pulp was then placed in a graduated litre cylinder, where its level stood at the 875-c.c. mark. At the end of 24 hours the solids had not subsided through more than four divisions of the scale, a distance equivalent to 40 c.c. of solution.

Another fact pointed out by the same authors, in regard to the quality of the settled slime produced by different electrolytes, is also exemplified on this material, for the use of caustic potash instead of lime produces a curd of much finer grain, which settles better in every way, and finally yields a good clarification also, though the latter proceeds more slowly than the subsidence of the well-marked line of solids, and the solution has not the brilliancy of that settled with lime. Thus, if the filter method had not been adopted it is probable that caustic soda or potash would have been more useful than lime as a protective alkali.

In regard to the settlement in distilled water, if it be true that some degree of coagulation is a necessary precursor to settlement and clarification, then the slime being treated must either possess some inherent power to coagulate, or else, in spite of thorough washing, must develop sufficient soluble material by standing in water to form an electrolyte suitable for this purpose.

It may be interesting here to give a few results, out of a number of determinations, on the rate of settlement of this slime. These tests were made on an average sample such as is usually treated in the vats. The accompanying diagram will illustrate. (See Fig. 1.) The arrow-heads denote the defined surface lines of subsiding solids; the

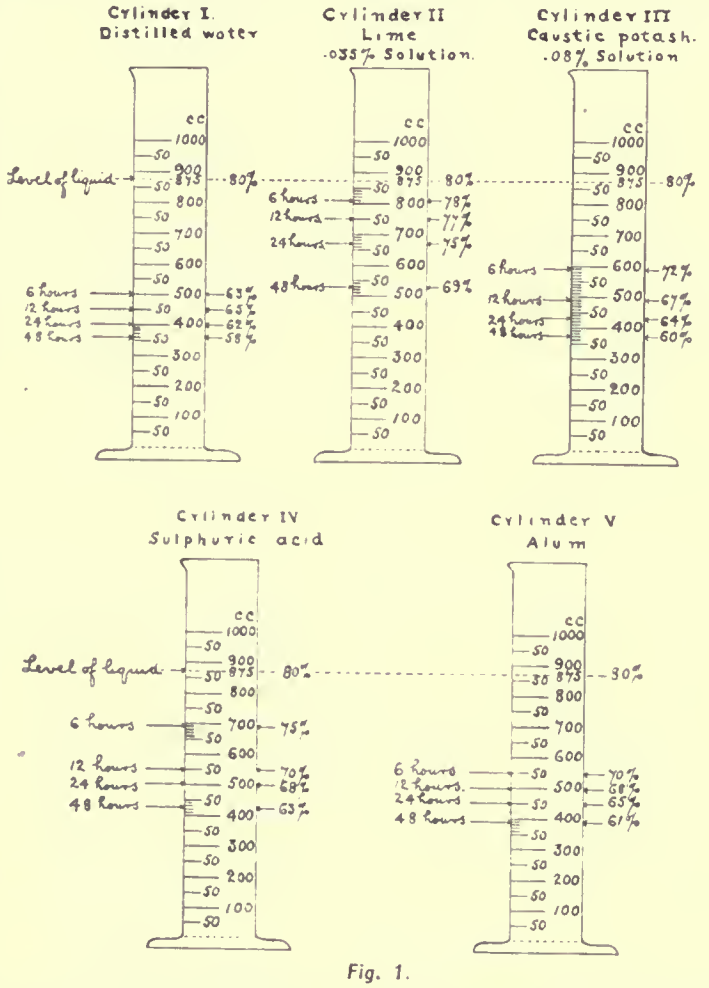

Fig. 1.

percentage figures on the right-hand side of each cylinder represent the percentage of moisture still held by the settled slime at that point. The following notes will explain:

CYLINDER No. 1.—This sample of slime was washed in 10 changes of clear service-water, the operation extending over several days, and finishing with distilled water. When this last wash had been settled and decanted, distilled water was used to bring up the dilution to 4 to 1. The line of subsidence was well defined from the start, but the liquor retained a faint opal tint, which did not disappear throughout the test.

CYLINDERS No. 2 and 3.—These were both neutralized with their respective alkalis for two days before beginning the test, so as to insure having an approximately constant strength of free alkali in solution during the time of settlement; in the case of the lime this strength was 0.035% alkalinity, and in that of the caustic potash 0.08%, both in terms of caustic potash.

Similar tests, made with considerably larger amounts

of free alkali in solution, showed slightly inferior results in the case of lime, but a tendency to closer settlement with caustic potash. In the case of cylinder No. 2, the lime left a sparkle and limpidity of the supernatant solution lacking in that settled with caustic potash, though the latter might be said to be perfectly clear unless compared with No. 2, when a difference would become apparent.

CYLINDER NO. 4.—In this test the same amount of slime was taken as before, and the same proportion of water added. Sufficient pure sulphuric acid was then mixed with it to leave a little free acid in excess after dissolving all it would of soluble material. In this medium the slime settled better than in the lime solution, but the liquid remained slightly opalescent.

CYLINDER NO. 5.—To this 5 grams of alum were added and allowed to dissolve, giving a result nearly as good as that obtained with caustic potash, and a solution of about the same degree of clearness, that is, clean, but lacking the absolute purity of the lime solution.

The experiments here given will be sufficient to indicate the nature of the material to be treated, which has a bearing on the results obtained by the use of the filter.

After experimenting with several forms of vacuum-filter units, both cylindrical and rectangular, the system hereinafter described was finally evolved, and very few changes have been made in it since the first appliance was installed on a working scale in the Virginia City plant.

As at present constructed the filter-leaf is made on a frame, the upper side of which is formed on a bar of wood, 1¾ in. thick and 5½ in. wide, placed on edge, and 10 ft. in length, or sufficiently long for its ends to rest on top of the containing-box from side to side. (See Fig. 2.) The remaining three sides of the frame are made of ½-in. pipe, one extremity of which is flattened, turned at a right angle, and firmly bolted to the under side of the wooden bar, while the other extremity projects through the other end of the same bar, in order to receive its connection with the vacuum-chamber, being tightly clamped to the wood at the point where it passes through. The upper face of that portion of the pipe forming the bottom of the frame is pierced with 5/16-in. holes at intervals of four inches for its whole length, and through these the solution passes off from the filter into the receiver.

The filtering medium consists, first, of a piece of cocoa mat, of such a size as exactly to fill the space formed by the frame described above. On either side of this is placed a sheet of 16-oz. canvas, large enough to overlap the frame. These three thicknesses of material are then sewed together by machine with parallel rows of stitching four inches apart,* and perpendicular to the sustaining wooden bar. Next, the filtering medium so formed is fitted in the frame, the overlapping canvas edges being stitched round the outside of the piping, and the upper edge fastened to the wooden bar by being sunk in the groove shown in the drawing and a lath driven in over it, wedging it firmly in position. This lath is also made to fulfill another function; instead of being of such a thickness as to be driven flush with the surface of the wood, it is made to project outward for a distance of about half an inch, and the under side of this projection is grooved or weathered so as to deflect the drippings of solution that run down off the bar when the pulp is withdrawn, and prevent them from trickling over the surface of the newly-formed cake. This action was found to cut channels in the surface of the slime, and form the starting points of cracks. A point to be noticed in the section (of the head of the frame) is the shoulder, formed by the lower angle of the wooden top, over which the canvas has to be strained before reaching its attachment. The lack of support at this point between the canvas and the cocoa mat was found to cause a tendency to start cracks in the cake, and to avoid this the material is rendered impervious with P. & B. paint down to the line at which it comes in contact with the mat, which is about 1½ in. below the lower extremity of the wooden support. At this point there is a horizontal line of stitching holding the three thicknesses of material together. The paint is also applied all round the frame of pipe in a border about an inch wide, for the same reason, and this has proved a simple way of meeting the difficulty and giving the cake a perfectly plane surface on which to build itself up.

After everything has been done, six or seven strips of wood are placed vertically on each side of the leaf, thus dividing it into a number of panels of equal size; these reach from top to bottom of the frame and are screwed together through the filtering material. They act as braces to stiffen the frame and also to hold the canvas vertical and prevent it from sagging out to one side or the other.

For localities where water is scarce, and generally where it is desirable to send out a comparatively dry cake, the frame of the leaf is now modified to admit of throwing off the cake without previously submerging it in water as is done at Virginia City. The frame of pipe in this case is made to extend round all four sides instead of only three; the extremities pass through the wooden bar at each end instead of only at one end of it, and the pipe at the upper side of the frame is perforated like the lower one. By this arrangement, water can be injected into the leaf along the top through one of the projecting extensions of the pipe, and simultaneously compressed air can be admitted through the other pipe into the lower part of the frame. This has been found to make a perfect discharge of the cake into the empty box, whereas water alone could not be made to give a proper discharge unless the cakes were submerged.

Compressed air, alone, can be used for a dry discharge, but it is not as satisfactory as the combination of water and air simultaneously. (See Fig. 3.)

At Virginia City the containing box is an electrolytic precipitation box which was not needed for its special purpose and was adapted to the use of the new filter, being allowed to remain in its original position. It was formerly divided into 12 compartments, each having a hopper-bottom; the partitions were removed, and with them two of the sides of each hopper, so that the whole space was vacant from end to end, and after the heavy top rails had been removed the result was a box 31 ft. 8 in. long and 9 ft. 11 in. wide, the sides being vertica for a depth of 5 ft. and then meeting the V-shaped bottom.

In place of the top rails, boards 5¾ in. wide and 1 in. thick were placed horizontally on the top edges of the box, and on the outer edge of these were fixed vertical boards 12 in. high and 1¾ in. thick, all being well bolted together and to the box, the result was to raise the sides 10 in. higher than they were when used for precipitation. The two shelves thus formed along the sides of the box serve to carry the ends of the filter-leaf bars and allow the leaves to hang free inside the box. (Fig. 4.) On one side of the sloping bottom and extending down to its lowest point are four discharge-doors, each giving an aperture of 12 in. square; the doors are hinged on their lower sides, and seat on a rubber insertion led into the iron frame; they are closed by hand, and then held in position by a lever. To discharge the contents of the box it is only necessary to shift the lever, and the door drops open by its own weight. At each end of the box

*The latest plan is to have these rows of stitching only one inch apart; this gives greater strength and rigidity.

is another door 10 in. square, through which the nozzle of a hose is manipulated for flushing out any hard slime that may remain behind in the bottom.

When designing a containing-box for the special purpose of the filter, the lines of the original box are departed from as regards the shape of the bottom, which is

by the Rix Compressed Air & Drill Co. of San Francisco, and is described in their catalogue as a "vertical duplex blowing engine." It has two cylinders 14 in. by 8 in. and is belt-driven, the crank-shaft making 120 rev. per min. Only one cylinder is used for the purpose of the filter, the other being connected with a separate drum

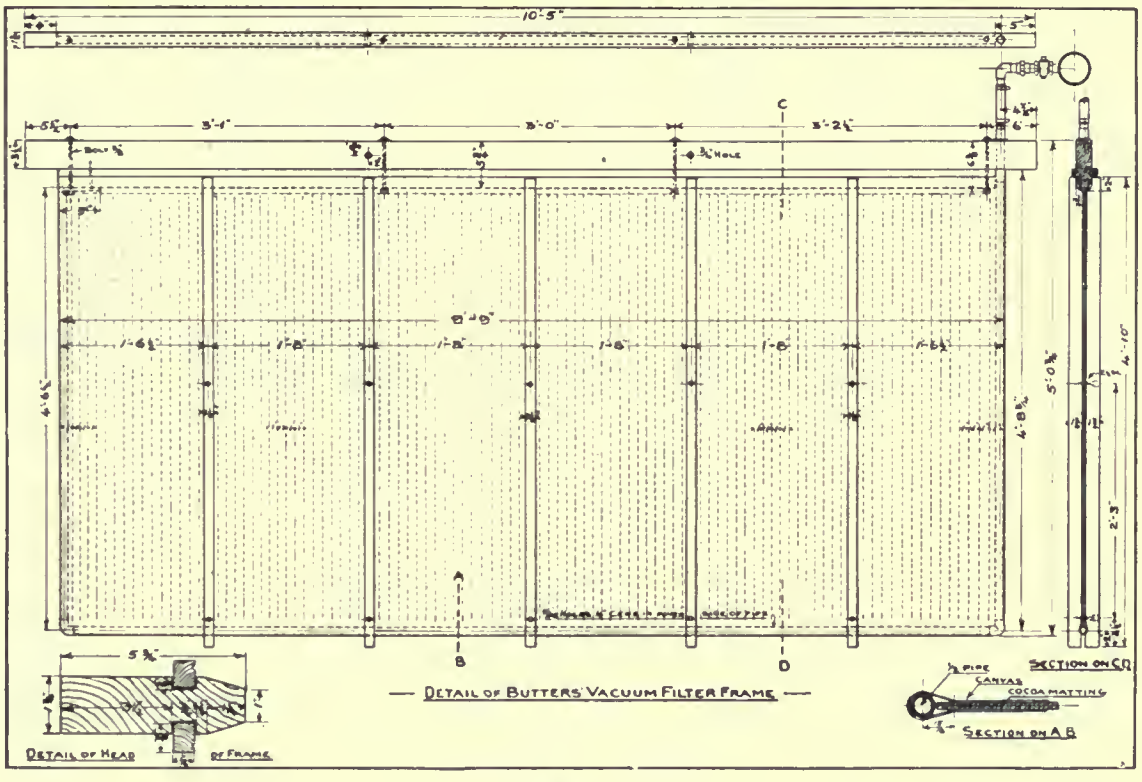

Fig. 2.

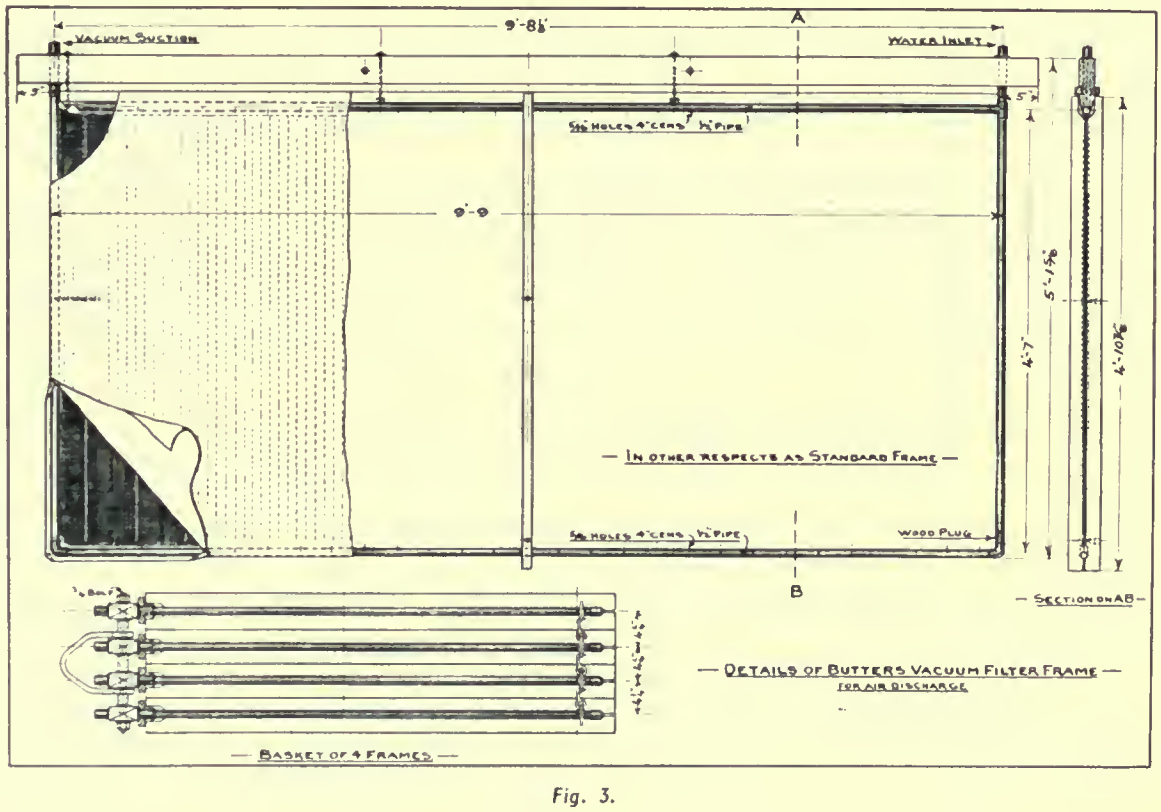

Fig. 3.

then composed of one or more complete hoppers of about 60° for the better discharging of the cake, and the door of each hopper is placed at its apex and may be a 12-in. quick-opening valve or any other suitable device. With such an arrangement the residue gravitates out without the aid of any washing with hoses.

At Virginia City the exhaust-pump is a converted compressor, which happened to be on hand. It was made

and used to form a vacuum for drying out the final washes from the sand-leaching vats.

The vacuum-drum is of riveted boiler-plate, and is 3 ft. 8 in. diameter and 13 ft. 4 in. long, standing upright on its end. The pipe from the vacuum-pump enters at the top, while the pipe connecting with the filters enters 1 ft. from the bottom. At or near the bottom a drain-pipe enters, for removing the

solution as it is drawn in from the filter-leaves. This pipe passes down into a small sump 22 ft. below, so that the solution will drain by gravity and keep the chamber empty. The level of the solution in the sump is, of course, always kept above the discharge to prevent the entrance of air into the drum. The average barometric pressure at the level of the works is 21.5 and the average vacuum maintained is 22.5 in., which is indicated by a column of mercury connected with the drum. As the small receiving-sump fills with solution, it is periodically pumped into a storage-vat, from which it passes to the precipitation-boxes.

Instead of the dry vacuum-pump and gravity-drainage, a 'wet' vacuum-pump may be used, which would obviate the necessity for placing a solution-sump 20 to 30 ft. below the filter-level, in cases where such an arrangement might be difficult or undesirable.

The filter-leaves are placed in the containing-box at a distance from each other of about four inches from centre to centre, and are then ready to be connected with the vacuum-drum. One space is usually left vacant midway along the box to allow access to the surface of the leaf for purposes of measuring the formation of the cake, and also of admitting an electric light to observe its condition after the charge of pulp has been withdrawn. Blocks of wood are fastened on the shelves that carry the filter-leaf bars to act as spacers between the leaves, and it is generally found advisable also to use a line of blocks or

iron clamps down the centre of the row of frames to prevent the bars from sagging horizontally toward one another under the weight of the cake. The ends of the bars, too, need to be held down in their places by wooden buttons, to prevent them from floating up by the action of the buoyancy of the thick pulp.

A 4-in. pipe runs the whole length of one side of the containing-box, and has a number of small horizontal holes bored in it, one exactly over each filter-leaf; into each hole is screwed a ½-in. nipple and plug-cock, on the further side of which is a union into which screws the small end of a reducing ell; the large end of the small ell enters a short length of rubber hose, which connects with the projecting end of pipe from the filter-frame (Fig. 2). Thus, by unscrewing the union any individual leaf may be disconnected and removed from the box in a few minutes.

At each end of the 4-in. pipe is a quick-opening valve; one is connected with the vacuum-drum, and by opening it the suction is applied to the filters. The other unites with a low-pressure water service of about 20 ft. head, and through it water is admitted between the two sheets of canvas for the purpose of detaching the residue-cake prior to discharging.

There is also a ¾-in. pipe running all round the top of the box; this has holes pierced in its under side, and is connected with a small solution-vat above; its function is to form a spray to wash down the sides of the box when the pulp is withdrawn, so as to reduce to a minimum the amount of slime introduced into the solution-vat when the subsequent wash is thrown back, and also to minimize the loss of valuable solution in cases where, as at Virginia City, a water-wash follows directly on the withdrawal of the surplus pulp and is discharged with the residue-cakes.

The charge of slime, after being treated by agitation in the ordinary way, but not having received any subsequent washes, is allowed to settle for 24 hours in the treatment-vat. When the clear solution has been decanted, the charge is stirred up and run into a deep settlement-vat, of which there are three in use at the present time. Here it settles, usually for two or three days, and from here, after being decanted as closely as possible, it is taken directly into the filter.

This method of feeding the filter works well with the peculiar slime under discussion, but for the more ordinary kinds of slime and particularly when there is much fine silica present, it is found advisable to have the stock pulp-vat fitted with a mechanical stirring-gear to keep the slime from settling too hard for pumping and to give a homogeneous product to the filter.

All transfers in connection with the filtering process is performed by a single 6-in. centrifugal pump (see Fig. 5) with valves and levers so arranged that the man in charge can carry out each operation without moving from one spot. From an examination of the pipe-connections with this pump it will be seen that it will first draw pulp from the feed-vat and throw up through the bottom of the filter-box; next, it will draw from the filter and throw back through the bottom of the feed-vat; it will then draw from either the solution-vat or water-tank to fill the filter-box and return the same to where it came from.

This may look complicated on paper, but it is perfectly simple for the operator, and a new hand will learn the whole routine in a couple of days. Within easy reach are, first, the clutch-lever for starting and stopping the 6-in. pump, and another for the 4-in. centrifugal used for emptying the drain solution sump; second, two small winches connected with wire-cord with the two 3-way valves, each having a dial indicator visible from his station to show exactly the position of the valve; third, four iron handles projecting through the floor at his feet, for opening and closing the straight-way valves of the system: these also are marked, so that there may be no mistake. Within three feet of where he stands the filter-box is situated, and close alongside is the vacuum-drum with its mercury-gauge, and gate for opening and closing the main vacuum-pipe; and 30 ft. away, on the same level, is the valve that admits water to the leaves for detaching the cake. Thus, the only occasions on which he need move more than a few feet from his station are, (1) when he has to go below to manipulate the discharge-doors of the box, (2) when he has to change from one feed-vat to the next one, and (3) when it is necessary to oil or pack one of the pumps.

[TO BE CONTINUED.]

HOW AN INFANT SALTED VANCOUVER.—In the early part of the present month no little excitement was caused by a most interesting story circulated by the daily press of Vancouver, and at once telegraphed broadcast throughout the land, to the effect that alluvial gold in paying quantities had been discovered in the east end of the Terminal City. The details were comprehensive, names of the fortunate finders were given, and public expectation of a new Klondike on Burrard Inlet was raised to fever heat. Developments were anxiously looked for. They came. We will let our contemporary, the Vancover *Province*, tell the sad story in its own inimitable way:

"W. J. Haddock, partner in the firm of Parsons, Haddock & Co., produce and commission merchants, is part owner of a mischievous nephew. Three years ago Mr. Haddock came down from the Cariboo district, after spending several seasons in that country. He took rooms with relatives who live at the corner of Keefer street and Dunlevy avenue. Among the treasures which Mr. Haddock brought from Cariboo was a little sack of nuggets worth a hundred dollars. One day Mr. Haddock's nephew, aged about 5, was left alone in the house. He selected as his particular plaything this little sack of nuggets. When his elders arrived home, the hopeful was found playing in the ditch at the corner of the streets mentioned. In his hand was the sack, but the nuggets? What became of those nuggets? Last week the entire east end of Vancouver was agitated by the story of the finding of a number of nuggets in this identical spot. Painful though it may be, the truth must be told.

"It's a sad life we live, all right, all right. Especially when we have to knock the town."—*B. C. Mining Exchange.*

QUEENSLAND is not only the home of the opal, but authorities declare that the State contains a greater variety of gem stones than any other country in the world. Unfortunately, however, because of natural obstacles difficult to surmount, the opal industry has not developed as rapidly as the excellence of the gem should warrant, but in spite of trying climatic conditions and other handicaps which confront the miner in the quest for these stones, it is estimated that opals valued at fully $1,000,000 have been found in the Queensland field and distributed all over the world. The opal is found in matrices of ironstone, sandstone, and occasionally in pipe clay, and is roughly classed as boulder opal, sandstone opal, and pipe opal. The commercial value of the uncut gems depends so entirely on their quality that it is difficult to quote prices without giving a detailed description of a particular gem and affixing thereto its value in the fields. The same difficulty obtains with regard to opals after they leave the lapidary's hand.

The Great Silver and Lead Mines.

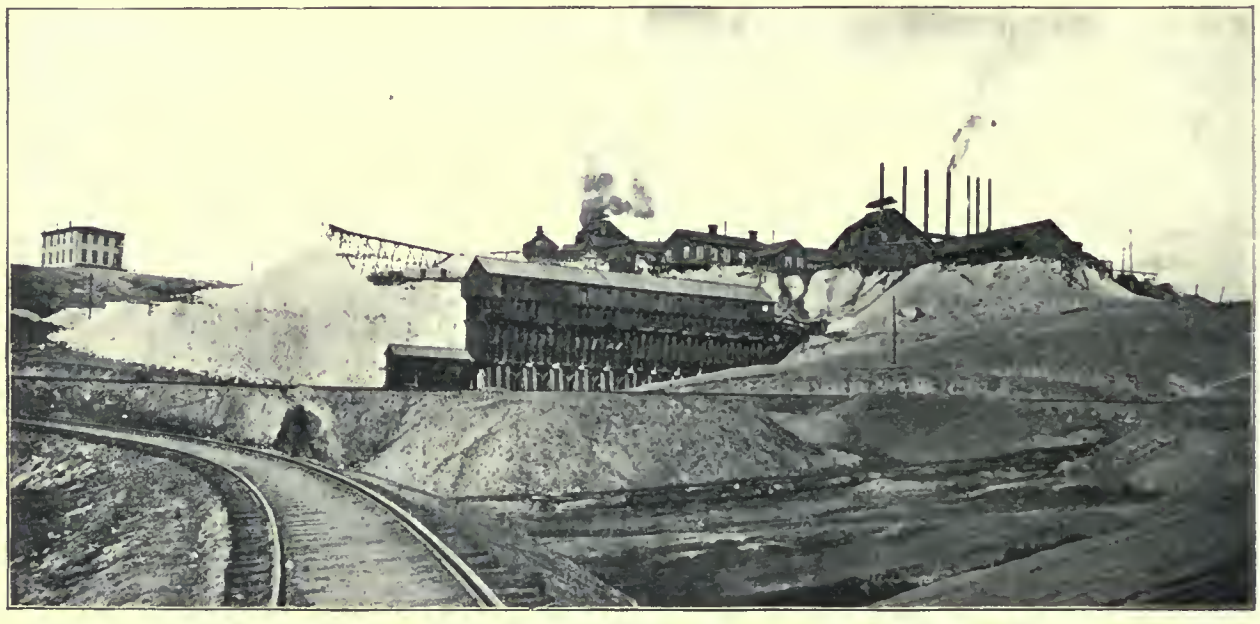
Written for the MINING AND SCIENTIFIC PRESS
By T. A. RICKARD.

To children their elders look like Olympians and to most of those engaged in mining the famous bonanzas seem potentialities of wealth beyond the dreams of avarice. They are interesting as being the biggest of their kind. In a recent issue I gave a list of the great gold mines, and on this occasion I shall refer to those that produce silver and lead. This is less difficult than the enumeration of the principal gold mines, for the yield of the white metal is nowadays so largely a by-product in the exploitation of ore deposits containing gold and copper, that the really distinctive silver mines of any magnitude can be counted on the fingers of one hand.

The Broken Hill Proprietary mine, in New South Wales, continues to be at the head of all the productive silver mines of the world. Next comes the Tonopah Mining Company of Nevada. It may be claimed that the Federal Mining & Smelting Company should be given second place, because it makes a production bigger than that of the Tonopah, but the Federal Company is a consolidation of five properties. They are neighbors of the Bunker Hill & Sullivan, in the celebrated Cœur d'Alene district. The following data will be of interest:

Company.	Tons of ore.	Ounces of silver.	Profit.
Broken Hill Proprietary Co.			
Year ending November, 1906	523,551	4,615,430	$2,954,110
Bunker Hill & Sullivan Mining & Concentrating Co.			
Year ending November, 1906	338,879	1,598,426	2,435,016
Federal Mining & Smelting Co.			
Year ending August 31, 1906	874,332	3,920,884	2,685,213
Tonopah Mining Company of Nevada.			
Year ending December 31, 1906	66,586	3,194,309	1,379,867
Tonopah Belmont Development Co.			
Year ending December 31, 1906	16 153	933,981	386,721
Anaconda Copper Mining Co.			
Year ending December 31, 1906	1,494,828	2,979,908	8,842,669
Nipissing Mines Co.			
11 months ending March 30, 1907	2,432	1,482,767	841,241

The mine last mentioned affords a curious contrast with the others in point of tonnage, for the Nipissing ore is specimen stuff carrying slabs and masses of native silver, in association with cobalt. Of cobalt ore 31 tons were shipped. This mine is in the Cobalt district, of Ontario, Canada, and has been rendered famous both by its richness and the manipulation of its stock. As the Huanchaca mine in Bolivia has ceased to be highly productive and the Leadville mines are valuable as much for their zinc and iron ore as for their silver and lead, there are not many silver mines of the first rank. The Iron-Silver Mining Co. of Leadville produced $1,089,808 in 1906 and made a profit of $515,127. The yield included 425,050 oz. silver, 2,043 oz. gold, 69,477 lb. copper, 4,542,938 lb. lead, and 61,738,134 lb. zinc. The multiplicity of metals is typical of Leadville at the present time. This varied output came from 145,120 tons, of which 139,049 tons are credited to the Moyer mine. The Anaconda Company's mines at Butte, produced 2,979,908 oz. silver during 1906, as an incident in copper mining. The copper mines of Bingham also yield silver, although the amount is not enough to rank them individually as important producers of silver. The Tonopah ore contains a large proportion of silver, with the gold. The premier mine of that district, the Tonopah of Nevada, yielded $2,463,200 in 1906, the ore containing 3,194,309 oz. silver, and 36,068 oz. gold. This mine is paying quarterly dividends of $350,000, of which one quarter comes from the Tonopah & Goldfield Railroad Co. During 1906 it earned $1,379,867 in profits, from 66,586 tons of ore, while the neighboring Belmont mine earned $386,721 in profits from an output of 16,153 tons, producing nearly a million ounces of silver.



Belle and Diamond Mines of the Anaconda Copper Mining Company.

The three chief sources of lead are quoted herewith and with these figures we give the dividends paid by the mining companies, whose silver production has already been stated.

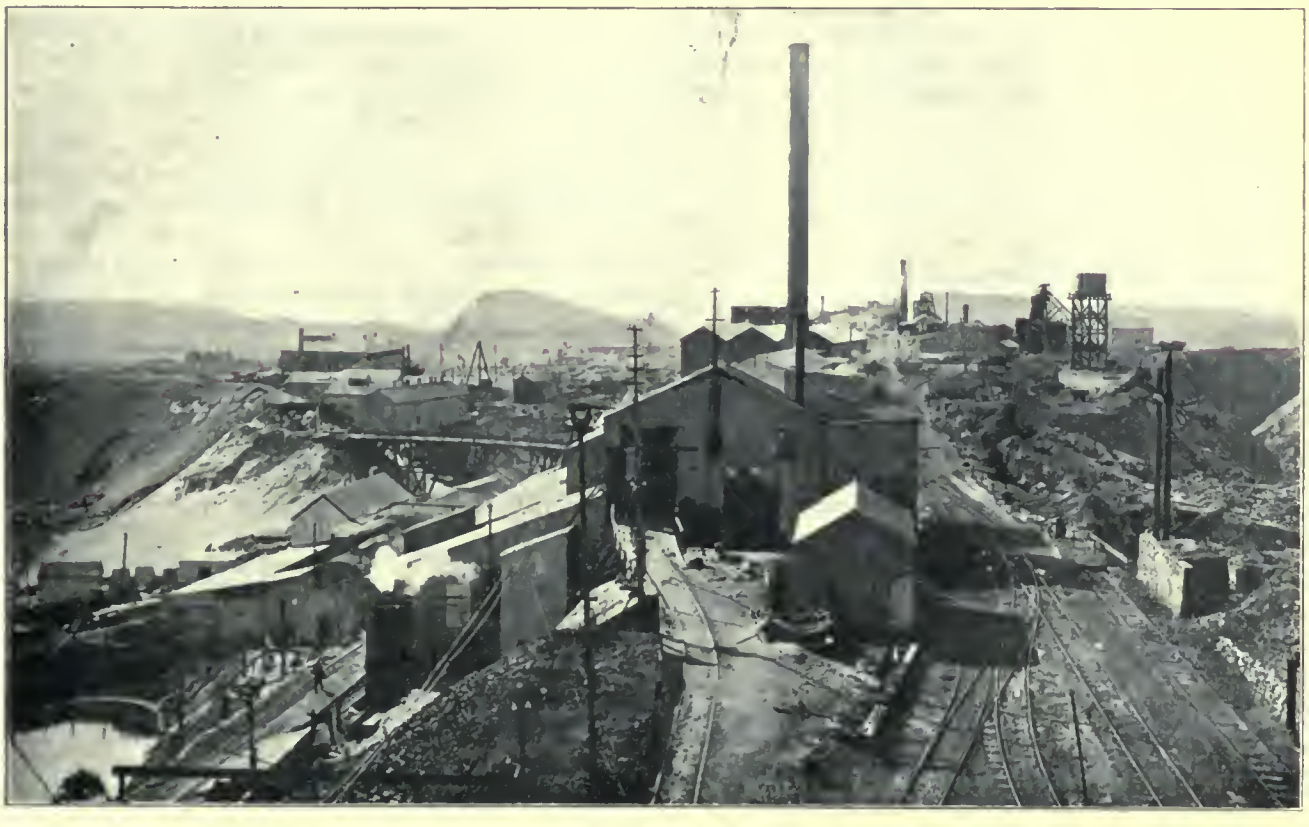
Company.	Lead. Tons.	Dividends.
Broken Hill Proprietary		
Year ending November 30, 1906	57,248	$2,095,200
Bunker Hill & Sullivan		
Year ending November 30, 1906	40,133	2,280,000
Federal Mining		
Year ending August 31, 1906	63,029	1,647,456

At the last meeting of the Broken Hill Proprietary Company, it was stated that the Barrier district had, since its discovery in 1885, yielded 20,000,000 tons of ore, from which 2,500,000 tons of lead and 250,000,000 ounces of silver had been extracted. The value of the product was £60,000,000 or nearly $300,000,000, while the dividends paid aggregated £13,750,000 or $66,687,500. Of these dividends the Broken Hill Proprietary Company

has paid $44,387,200 on a capital of £384,000 or $1,862,400. In the year ending May 31, 1891, this mine produced 242,557 tons of ore, yielding 8,790,670 ounces of silver and 38,563 tons of lead, valued at $5,507,508. During the last six months 121,895 tons of tailing were treated, producing 32,181 tons of zinc concentrate. This is a comparatively new source of revenue and it promises to grow to much larger proportions.

It may be added that the mines of British Columbia yield about 30,000 tons of lead annually, and 3,000,000 ounces of silver. The Joplin district in Missouri contributes 17,000 tons of lead and the counties of St. Francois and Madison, also in Missouri, produce 90,000 tons, out of the 350,000 produced in the whole United States. The total production of the world is about 1,200,000 tons. Germany yields 150,000; Mexico, 100,000; Australia, 120,000 tons.

While the production of lead is increasing, in response to the higher prices for the metal and the greater skill in milling methods, it is noteworthy that there is no such activity in the search for new mines as there is in the exploration for copper deposits.



The Broken Hill Proprietary Mine.

THE mines department for the colony of Natal has just given out a preliminary statement of the colony's mineral output for the year 1906. We are informed that the mineral output was valued at $2,573,472, and consisted of 1,238,713 tons of coal, 50 tons of lime, 73 oz. gold, and 3 tons of copper ore, the last named being only for samples. During 1905 prospecting was carried on for both asbestos and graphite, but nothing was done last year toward their development.

NOTICE.—THE STANDARD CONSOLIDATED MINING Co., of Bodie, Cal., is in want of experienced miners and laborers for general work; miners can earn $4 and laborers $3 per day; pay is prompt and steady work is assured to good men; board and lodging cost $26 per month and the climate and work are healthy.

The Prospector.

Enquiries sent to this department are answered free of charge, if submitted by subscribers who are not in arrears. The full name and post-office address of the sender must be given, otherwise no answer will be made. Those who are not subscribers must accompany their questions with a fee of $3 for each question. No assays are made.

The mineral sent from Placerville by G. is Gypsum.

The rock sent by W. F. W., of Shingle, Cal., is a Shale.

A volcanic Tuff was sent by T. A. B., of Breckenridge, Colorado.

W. H. W., of Amalie, Cal., sends: No. 1, Pyrite and Arsenopyrite; No. 2, Sphalerite.

The specimens sent from Woody, by J. W., are: No. 1, Chalcedony; No. 2, decomposed Biotite; No. 3, Tremolite; No. 4, Pectolite; No. 5, silicified rock stained with Limonite; No. 6, brown Garnet.

From J. W. at Calumet, Mich., we have received a specimen of Chalcocite, with native copper.

The mineral from Guerrero, Mexico, sent by W. N., is Torbernite, a phosphate of copper containing uranium.

ONE OF THE INTERESTING FACTS presented in the statistics of coal production last year is that West Virginia has supplanted Illinois as the second coal-producing State, West Virginia showing a total output of 43,276,185 short tons, while the production of Illinois was 41,497,435 short tons. This was due principally to the almost complete suspension of mining in Illinois (as in other States where labor union forces were strong) during all of April and a part of May, where the miners and operators were in conflict over the wage scale, whereas the majority of the operations in West Virginia were more actively worked, as a result of the suspension of work in the other districts.

The Work of a Purchasing Department.

In the case of small mining properties supplies are secured and distributed through the superintendent or manager, and in such case there is no need of a purchasing agent. With the growth of the company, or with consolidation, these duties have had to be specialized and put in charge of an officer that devotes his whole time to them. The men that are to use supplies, and he that buys them, should work hand in hand. The purchasing agent should, for example, consult the blacksmith regarding the grade or make of steel; the carpenter, regarding the grade of lumber; the master mechanic, as to castings or metals. The agent must try to get the best material at the lowest price, but it must be material that will be used intelligently by the different departments, a material that has been recommended by the superintendent or foreman of that department. The special and expert work of the purchasing agent lies in his constant watchfulness and study of markets and prices, in order to be able to take advantage of market conditions, and to act accordingly. He should be anticipating his wants and looking ahead, so as to be a judge of the future, of the upward or downward swing of the markets, buying liberally in anticipation of a rise in prices, and covering only immediate needs when there is a prospect of a decline. One way to keep informed is to note in the daily papers, and in Dun's and Bradstreet's reports, the trend of business conditions. The trade journals, such as the *Iron Age* and the *Commercial Bulletin*, give the trend of the markets. There are certain lines of materials, like iron and steel, that have a way of indicating general business conditions. In fact, it seems that other lines of business follow along, and when the slump or rise comes in these staples, one may expect to see other material affected in like manner. Another way in which the purchasing agent is bound to absorb much information of this kind is by keeping in touch with, and by frequently seeing and talking to, the representatives of the trade. These men, many of them, are as well posted in business affairs pertaining to mining supplies as can be found, and are most willing to talk prices and discuss the outlook. The element of personal judgment comes in here, and the purchasing agent soon learns to get at the facts. Today, as never before, we are up against a combination practically without competition in iron and steel prices. The United States Steel Corporation makes prices, and all have to follow. They control also the prices in pipe, and in a large measure, fittings. Much of the purchasing agent's business is likely to be done by telephone, and to be able to conclude business quickly and without reference to books or memoranda, he should have much of his knowledge well in mind. With so much to learn and to think of, he has but little time to give to private business or speculation—in fact, to anything beyond his recreations and necessary social duties.

Previous experience in mining work leading up to the position of purchasing agent is of considerable advantage, and gives a man much more confidence in his reports and correspondence, and, in fact, in all his negotiations. Knowledge of how freight is handled assists in getting material to its destination—no small part of the work. He should be posted on the general make-up of supplies to enable him to judge as to what shipping directions to give out, whether by mail, express, by boat, or by all-rail, and to be fully informed as to the routing of materials by certain lines and connections, and in regard to the probable time of delivery. A general idea of accounts and an understanding of office detail is also a valuable qualification, though not so important.

The purchasing agent is appointed by the manager and so reports to him. Sometimes he is classed in the operating department, but he more properly belongs in a department by itself, since the work differs from any other. He has authority over the material required for operation, not how or where it is to be used after he has secured it, but in seeing that the company has the right standard for its needs, and that it has been obtained at a satisfactory price. This is really the heart of his work. His advice is asked, and cost-reports on materials are called for in case of expenditures for improvements and additions. He is in position to know when best to purchase material for this extra work and improvement, and in this way he can render valuable service.

The scope of the purchasing department may be divided into two heads:

(1) Producing supplies. This includes the purchase and, after purchase, the delivery of material to its destination.

(2) The conservation of supplies or stores-work.

Beginning with the first head, the purchasing agent should be both in the office and in the field. The offices should be in charge of an assistant with a sufficient force to prepare and attend to orders, vouchers, invoices, and the necessary correspondence, and to turn out the work satisfactorily and promptly, subject to the supervision and direction of the purchasing agent. In the field he attends to the fuel, the timber, and lumber, and to the general stores needing his special attention. He also looks after the supply of fuel, both the proper kind and for the proper amount. If there are actual or threatened strikes in the coalfields from which the company draws its supplies, he must take action to protect the company in event of shortage. He is responsible for the inspection of the timber and lumber in quality and in quantity, and is looked to for the results of economy and good service.

Now the question may be possibly raised here: How does the purchasing agent know how much and what material to buy? Whence comes the information? The basis on which he works is the requisition. Requisitions show the quantity and kind of material, what it is to be used for, and how soon it is wanted. The departments using the materials make the requisitions, which are compiled under the direction, and with the approval, of the heads of the departments. These requisitions may be forwarded through the general storekeeper to the manager before they reach the purchasing agent. There are, however, exceptions to this rule, as when, in an emergency, the material is ordered by telegraph. In a case of this kind the purchasing agent may be expected to see that the cars for the materials are procured and placed promptly, and that the material is loaded and shipped without delay. Any delays in such instances are apt to mean increased loss, and of necessity such emergency supplies cannot wait for requisition procedure. Requisitions, having received the proper approval, come to the purchasing agent's office for his action. Some of the material, the price of which has been secured on contracts, which he has already made for a period of time, may be ordered at once. Material not contracted for is listed and sent to supply-firms with the request that they make bids. In this way, by the operation of competition, the lowest prices are secured consistent with the grade and quality of the material specified. When the bids have been received the orders can be placed, but considerable judgment is required in selecting the right bid. As a general proposition, the lowest bid takes the order. But besides the price, other things must be considered, as, for instance, whether or not the bidder can deliver the material within the required time, and whether from his past experience the purchasing agent

may be sure that the lowest price quoted covers the quality and kind of material wanted. These negotiations are often carried on verbally, as well as by correspondence, and at times a verbal arrangement may be better. Throughout the negotiations it is essential that the business be handled promptly, and that no efforts be spared to cover all points before the order is finally placed.

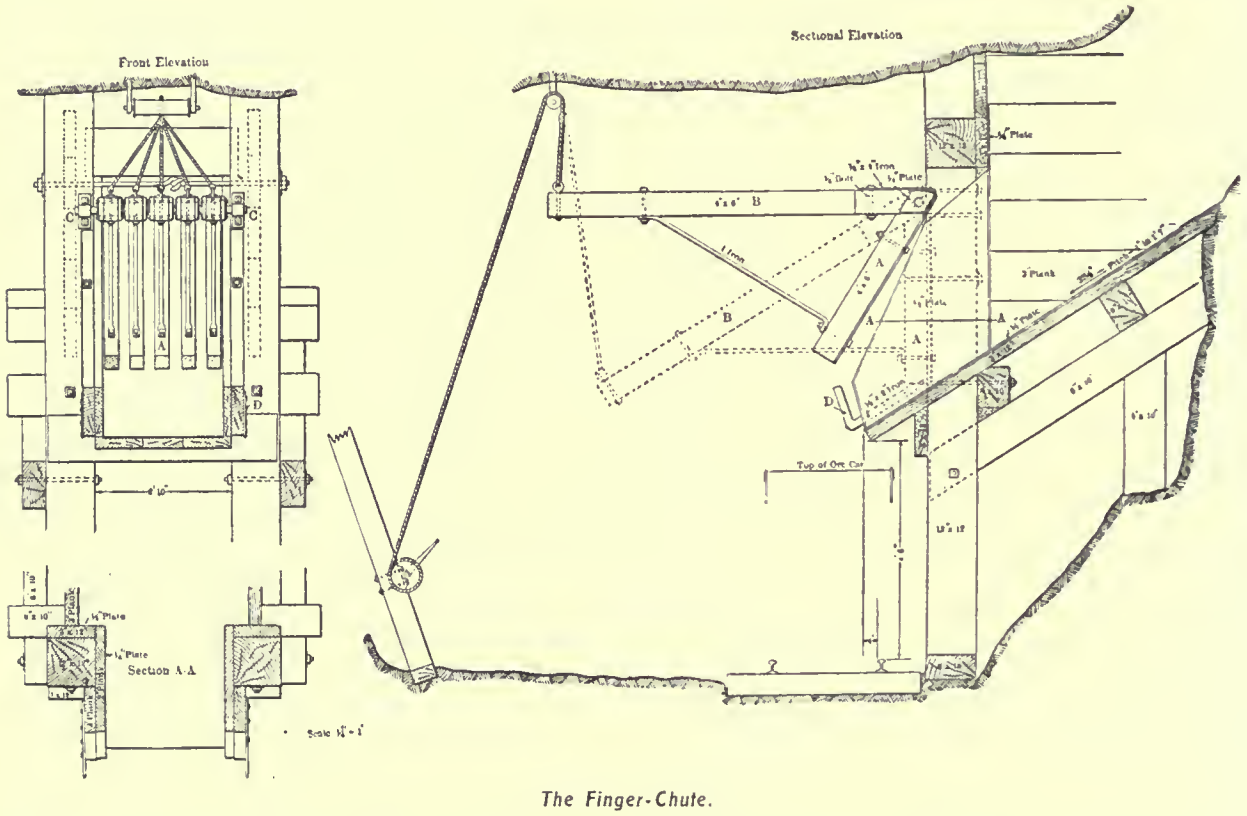
Regarding the question of quality and the inspection of supplies, the purchasing agent may often not know whether such material comes up to the required standard or quality. He is protected, however, by those who are naturally inspectors, as they are users, of it. It is a rule that when material is received that is inferior, or does not conform to specifications, it must be at once reported, or, if necessary, rejected. This information will come immediately to the purchasing agent, sometimes with much emphasis. He thus has a check on the quality of the material, and where specifications have not been complied with, the offending supply-firms are the losers. Owing to this natural safeguard, such mishaps are rare. To secure a standard of quality the specifications referred to above are printed and furnished to intending bidders. These specifications are prepared by experts in any department, who are to use such materials. While they do not cover everything which is bought, they furnish a substantial foundation upon which to base purchases. The users of the materials must see that they come up to the specifications. The mere purchase of material by no means completes the work; when orders are placed and accepted they must be followed up to see that the material meets no transportation or shipping delays. What are known as 'tracers,' both written and telegraphic, must be sent out in order to follow and hasten shipments of material that has been delayed, or which it is hard to secure after it has been ordered. There is, perhaps, no limit to the effort that may be thus spent. As to the kind of material that may be bought on time or other contracts, there is no rule other than the condition of the markets and the amount of a given kind needed. It is always safe to contract for fuel, mine timber, and for other material used freely and constantly. Such contracts are made subject to the judgment of the purchasing agent. As regards the conservation of supplies or the stores-stock, this is looked after by a storekeeper reporting to the purchasing agent, but sometimes to the superintendent or manager. A record of all materials purchased, as also a record of the requisitions, should be kept by the storekeeper. While all material is not delivered direct to the storehouse, some being delivered direct to the place where it is to be used, the storekeeper is expected to have a record of the material, quantity, cost, and by what department used. There are also many classes of materials, such as lumber and hardware, that must be kept on hand to be issued to different departments; they are to be bought in quantity and issued as needed. This stock, which may be termed 'running supplies,' is replenished as often as necessary by the purchasing agent on requisitions (properly approved) as received by the storekeeper. The storekeeper in turn issues these supplies from the storehouse on requisitions termed 'store-stock requisitions' or 'orders,' received by him from the foreman of departments or their agents. With his assistants, the storekeeper is expected to know at all times the condition of his stock, so that he may not run out of any item, and that he may know when and how much to order. To do this he may use a card system, or better, a loose-leaf system in which materials received are debited and issued credited to the storehouse. Such a system, to have value, must be vigilantly kept. Beside this system there should be a semi-annual inventory by actual count and measure. It is a test of the efficiency of a storekeeper to keep down his stock to the lowest practical working point, in order not to have more money than necessary tied up in material. For the purpose of facilitating the issue of these stores to different points there may be one or more outlying stores taken care of by a special clerk, accountable to the general storekeeper.

DEVELOPMENT OF ECUADOR.—Advices from Quito state that a contract has been signed by the minister of the interior authorizing the formation of The Eastern Ecuador Exploration Co., to be incorporated in London or some other place approved by the Government of Ecuador, to carry out the following objects: To construct a railroad from Ambato to some point on the Curaray river at or below the head of navigation; establish a port on the Curaray river at the terminus of the railroad; establish a regular line of steamers between the terminus of the road and the city of Para in Brazil, also to establish lines of steamers on any or all of the navigable rivers of the oriental region of Ecuador; explore the oriental region and exploit its riches, both mineral and vegetable; acquire temporary or permanent titles to mines, waterfalls, etc.; procure foreign immigration and provide for the settlement in this oriental region. The term 'oriental region' is defined to be all that territory lying between the eastern watershed of the eastern chain of the Ecuadorian Andes and the northeastern, eastern, and southeastern boundaries of the Republic, but the Government of Ecuador may fix the western limit of this region with greater accuracy if necessary or desirable. Plans for the railroad must be presented within one year from date of contract, and the capital which is used in the construction of the road will be repaid by the Government of Ecuador in bonds secured by special funds. When the plans for the road are accepted, permanent title will be given to the company to alternate tracts of land four miles wide along its entire length. Hydrographic and topographic maps of the oriental region must be completed by the company within five years from the time their work is begun and such maps will become the property of the Government. The company will have the exclusive right for five years to locate and file upon such properties as mines, rubber zones, etc., and to exploit such properties as may be thus located for 50 years; in the case of vegetable products title to the land which such products occupy is not conferred. Titles to mines may be acquired by fulfilling the usual conditions required by the Government of Ecuador and exploiting such property within 10 years from date of discovery. Employees of the company are prohibited by the Government from filing upon mining properties until they may have left the service of the company 10 years, unless permitted to do so by the company. Provision is made for fair dealing with Indians.

HYDRAULIC CEMENTS.—The hardening process of all hydraulic cements is mainly a process of formation of colloids and not a process of crystallization. The composition of the clinker is entirely immaterial to a certain extent, and many different compounds may be contained in the clinker; some of them are essential, while others may be present or absent, but no matter what the composition may be within certain limits, the hardening process invariably proceeds the same way and is due to the formation of a gelatinous substance, a colloid, which becomes solid in time and which is composed of calcium hydro-silicates, calcium hydro-aluminates, and calcium hydro-ferrites.

The Finger-Chute.

By request of several of our readers, we reproduce herewith a drawing of the finger-chute used in the Alaska Treadwell mine. This drawing is taken from the valuable paper by Robert A. Kinzie, appearing in Vol. XXXIV of the *Transactions* of the American Institute of Mining Engineers. From his description we quote the following: The so-called finger-chute is used throughout the island when a large amount of comparatively coarse rock is to be handled. The fingers are held in place by the weight of an arm, *B*, and are separately hung from the rod, *CC*, so that the motion of each is independent of that of the others. For the purpose of raising the fingers so that the ore can be drawn, to the top of each finger is fastened a piece of rope. These pieces are brought to a common centre and fastened to the main hoisting-rope, which passes over a pulley in the top of the drift and thence down to a small windlass. When ore is to be drawn, the fingers are raised to the height necessary to allow the ore to pass. When enough has been drawn, the fingers are released and fall into position, stopping the flow. If a large piece is caught on the lip of the chute, it will hold only the finger or fingers that come in contact with it, while the others drop to their normal position. To prevent fine dirt dripping into the roadway, a tail-board is put across the mouth of the chute and held in position by the angle-irons, *D*.



The Finger-Chute.

The cost of putting up chute-raise, cutting-station, and installing finger-chute complete, is as follows:

12 ft. of raise at $9 per ft.,	$108.00
80 cars of dirt at 20c.,	16.00
Cutting chute-station for windlass	40.00
40 cars of dirt at 20c.,	8.00
Building finger-chute,	17.58
Lumber, 700 ft. B. M. at $12.50,	8.75
Iron and steel,	40.00
Blacksmith-work,	7.00
Rope,	2.00
Total cost,	$247.33

The principal advantages gained by using the finger-chutes are dispatch in loading and freedom from blocked chutes and from spilling ore on the tracks. Their cost is prohibitive except where a large amount of coarse dry rock is to be handled, and in the Ready Bullion and Mexican mines they have been in a great measure superseded by the common board chute, which costs very much less. In the Treadwell they alone are used, and, as stated above, they are being put in at intervals of 20 and 15 ft., instead of 30 ft., as heretofore. The additional expense of putting in finger-chutes every 15 ft., instead of every 30 ft., is $8.33 per foot of drift. The saving in shoveling in a stope 60 ft. wide would be $12 per foot, making a saving of $3.67 by additional chutes; to which must be added the advantage of not losing time by chutes getting blocked. With chutes 15 ft. apart, the train can move with brief stops and be practically drawing from the same part of the stope. The blocked chute can be freed by one man and not delay the train more than 10 minutes. Also, in case the back of the stope should become so bad that men could not get in to work the ore into chutes, more than twice as much could be drawn from the stope with chutes 15 ft. apart.

A modification of the finger-chute is used for the skip and bin-chutes. They are made with six fingers and are 6 in. wider than the ordinary chute. A trough is added to carry the ore from the lip to the edge of the shaft. It is 9 ft. long, 3 in. wide, with an inclination of 36°, so that the ore will run freely from the lip to the skip. Attached to the end of the trough is a hinged door made of half-inch steel plate. When raised, it immediately and entirely stops the flow, and allows the trough to be filled in readiness for loading the next skip. It takes on an average 20 seconds to load a 4-ton skip and make everything clear for hoisting.

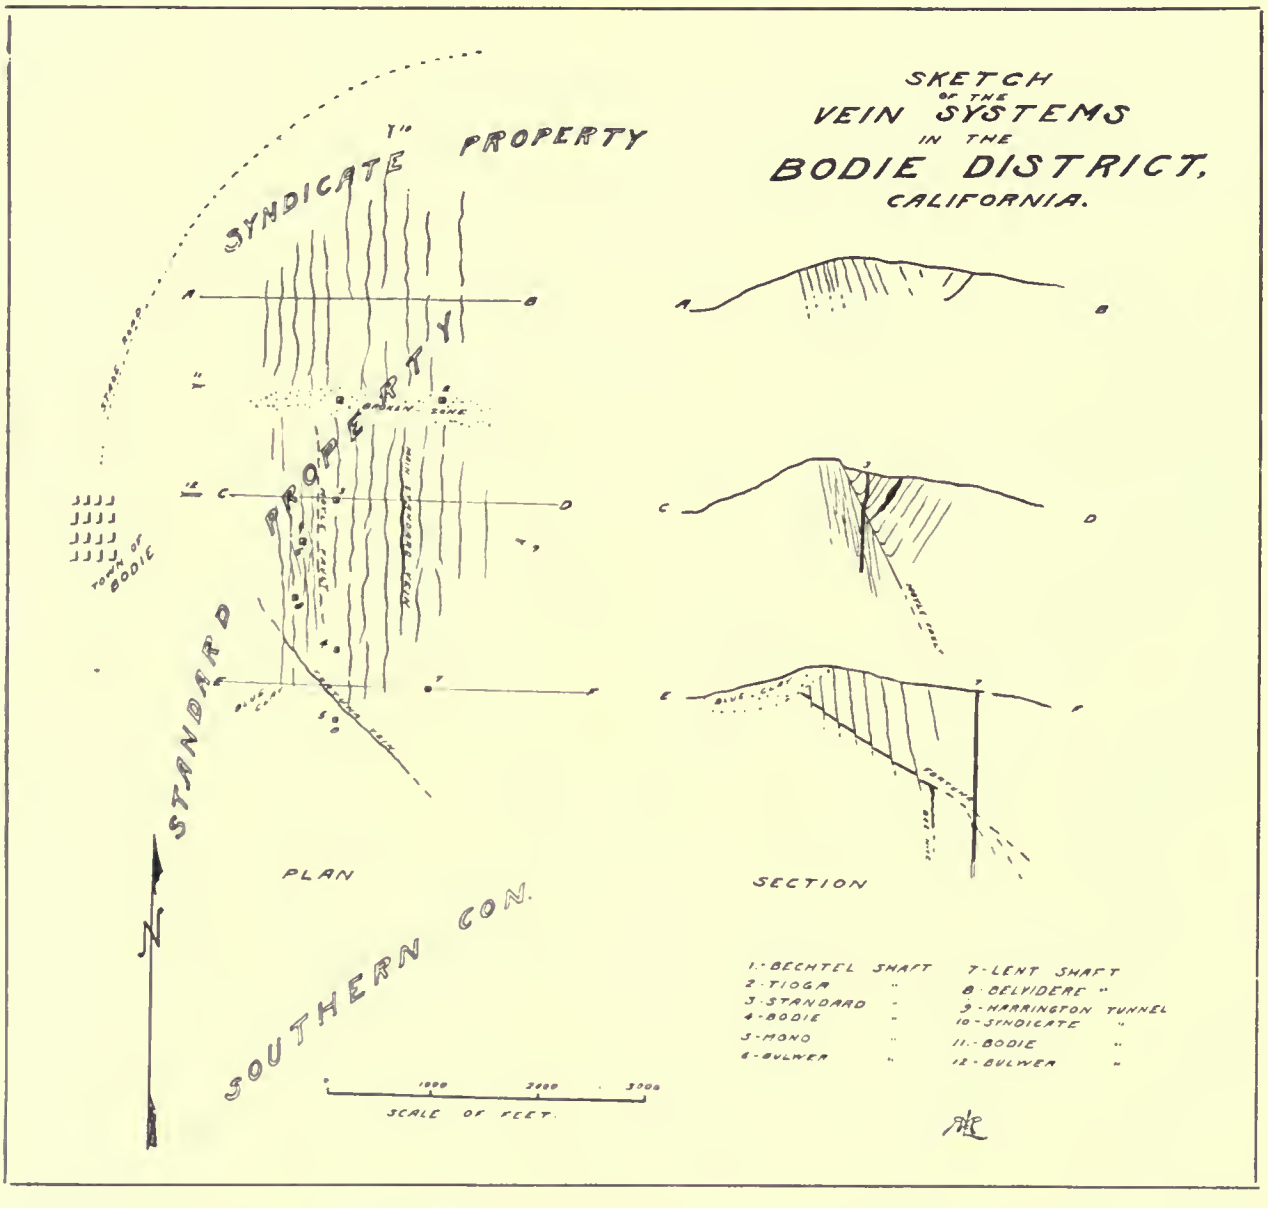
SUEZ CANAL PETROLEUM PROHIBITION.—The prohibition against carrying petroleum through the Suez Canal, which has been in existence for many years, has been removed. What this concession means to the users of this commodity will appear when it is stated that no less than 250,000 tons of petroleum are brought in bulk yearly to Europe from Borneo and Sumatra; and not to Europe only is the import made, but also to the United States.

Geology of the Bodie District, California.

Written for the MINING AND SCIENTIFIC PRESS
By R. P. McLAUGHLIN.

The following description of Bodie is offered because but little has been published upon this mining centre which, at one time, ranked among the foremost gold districts of California, its large production corresponding in a way with the present conditions in neighboring districts of Nevada.

The Bodie district is situated in Mono county, about six miles from the State boundary line between California and Nevada, and almost due east from San Francisco.



The nearest station is Thorne, at the southern end of Walker lake, in Nevada, on the Colorado & Carson railroad. The stage journey of forty miles west takes one past the old camp of Aurora and into the town of Bodie, at an elevation of 8,200 ft. above sea-level.

Historically the camp offers all the picturesque features portrayed in the stories of Mark Twain and Bret Harte. The "bad man from Bodie" was a phrase current throughout the Western States a few years ago as indicative of all that was rough in character. Gold was known to exist here in the early '60s, but it was not given much attention until about 15 years later, when rich ore was found. The boom days of the Comstock were almost past and the rich strikes at Bodie attracted the population of Virginia City in a rush probably as maddening as any of recent years. It was hoped that another Comstock lode had been found and the town became a miniature Virginia City with all of good and bad that the name stands for in mining and finance. At one time there were 30 companies operating hoists within the area of a square mile and a population of 10,000 was claimed for the town. The collapse of many ventures left the hillside strewn with monuments of reckless expenditure based on wild hopes.

The country for a number of miles around Bodie is andesite and volcanic mud containing fragments of andesite. The andesite is probably a surface flow on top of slate and shale, which are exposed several miles to the south, turned up at a steep angle as though by the Sierra Nevada granite, which extends along those mountains about 15 miles west of the district. In some of the underground workings near the Lent shaft, at a depth of about 500 ft., are found inclusions of black chert possibly altered from the underlying sedimentary rocks. Although the Bodie district has turned out several million dollars in dividends and is still a steady producer, and the only important mineralized area yet developed in the large county of Mono, no work has been done there by the U. S. Geological Survey. A few years ago, assistance was offered, by one of the Bodie mining companies, to take up this work, but it was refused by the Survey, on the ground that there had been criticism on some of its work as "post mortem." Other work has

been carried on, in the Mono Lake basin and on the glacial deposits flanking the Sierra Nevada, which resulted in interesting reports of doubtful economic value. The postponement of work at Bodie until its regular turn among the quadrangles, will reduce the chance of rushing into an "ante mortem" examination.

The gold-bearing quartz veins are confined, as far as present developments have shown, to a single ridge about one mile long in a north and south direction and about a quarter of a mile wide. This ridge is readily distinguishable from the surrounding hills by its light color in contrast to the dark rock extending for miles in each direction. Two theories would account for the formation of the hill. One is that it is a volcanic neck pushed up through the surrounding igneous rock (similar to the occurrence at Tonopah), and the second theory is that the ridge rock is the older and has been exposed by erosion, being preserved above the surrounding country by its greater hardness (as at Goldfield). Geologic work that would establish the relation of this hill to the rest of the country should prove of great service in prospecting.

The veins are 'true' fissures in the andesite, carrying gold and silver in about equal amount, and nearly all of them strike north and south with the ridge, varying but little over 10° either way from a vertical dip. The accompanying sketches are drawn to show the general structure and exact measurements are neglected. Most of the veins are from one to three feet wide and occur from three to one hundred feet apart. The ore-shoots are from 20 to 200 ft. long and dip southward in the veins.

A larger portion of the productive area has passed into the control of the Standard Consolidated Mining Company and my observations have been confined mainly to the extensive workings on this property. The Syndicate property to the north of the Standard has been developed by adits to a depth of about 500 ft. The Standard shaft is 1,000 ft. deep, there being about 400 ft. of water in it at present. The Southern Consolidated property, south of the Standard, has been opened by shaft and other workings to a depth of over 600 ft. The greatest depth attained in the district is at the Lent shaft, which is 1,200 ft. deep, over 600 ft. being under water now. Almost without exception the veins have failed to carry pay-ore to a greater depth than 500 ft. below the surface, but the great number of veins (over one hundred) and the great width of at least one (the Main vein of the Standard was worked by square sets; it was 60 to 70 ft. between walls at its widest, the ore being worth frequently $400 per ton) have made a long life and large production possible. Outcrops of encouraging size and value are rare, being obscured by surface debris and also pinching out. Nearly all the discoveries have been made by cross-cutting. The size and value of the veins vary so much that cross-cuts more than 200 ft. apart may entirely miss orebodies of considerable value.

A marked geologic feature exposed in the workings is a fault-plane (locally called the Moyle foot-wall) extending about 2,000 ft. north and south and dipping about 60° east. The present caved condition of the old workings prevents a study of this fault as far as is necessary to establish its relation to the vein systems. This fault-plane was once the basis of an apex suit, the contention being that it was the main lode of the entire system. Broken pieces of ore and clay fill the fissure, but it has never been worked as a vein. Consolidation of the contesting companies waived the necessity of a final legal decision after one jury had brought in the non-committal verdict that each party to the suit should be awarded what really belonged to it.

The Standard shaft cuts the fault-plane at a depth of about 500 ft. and settling due to stoping on the east, or hanging-wall side, has caused a scarp of 12 ft. on the surface, moving the collar of the shaft the width of a compartment (5 ft.) diagonally out of line to the north and east. The veins break and bend upward as they near the fault from the east side, showing the faulting to have been normal, as is the case in all the other faults observed. The veins on the west side are in very solid country and are undisturbed. More evidence is needed to establish the relation of the veins on the two sides of the fault, as a very great movement would be required to displace a single vein system into the present position, as shown in the sectional sketch.

About 700 ft. north of the Standard shaft there is a broken zone not less than 100 ft. wide north and south and of indefinite extent east and west. The zone is composed of leached andesite and clay, which is probably the final product of the leaching. There are also occasional fragments of quartz. This zone is probably an area of faulting and displacement of later date than the vein formation. North of the zone the vein system as far as developed seems to be the same as in the section at the Standard shaft with the omission of the Moyle fault-plane, which is not traced underground and gradually disappears on the surface as the scarp is followed either way from the Standard shaft. An old property line is near this zone; in the leached and crushed rock the Tioga shaft was sunk to a depth of about 800 ft., cross-cuts being run east and west from each 100-ft. station. No ore was exposed by these workings and they were abandoned, although recent developments have opened up the vein about 400 ft. farther north, and these veins are now supplying most of the ore produced in the district.

Southwest of the Standard shaft there is an area of blue clay, exposed by the underground workings but concealed on the surface by talus. Striated surfaces in this clay show movements in all directions and the entire mass may be decomposed andesitic talus.

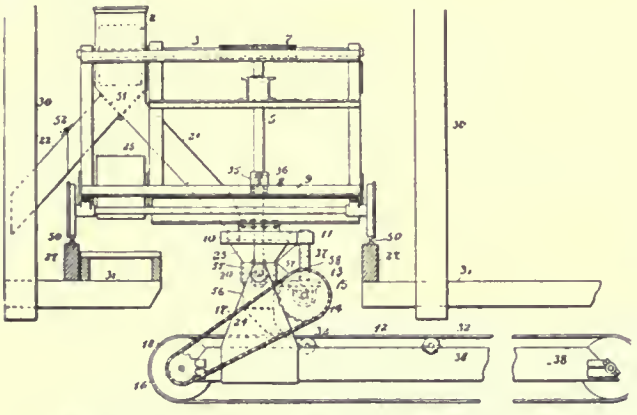
The oldest vein in the series is the Fortuna, lying in the southern portion of the Standard property and apexing in the mass of blue clay. Its strike and dip, so markedly different from that of any other veins in the district, make it remarkable, aside from the fact that it has been one of the richest. Where the younger veins cut the Fortuna, it is normally faulted from one to ten feet. The younger veins are said to have been enriched at the junction and none of them were worked out below, indicating an upward circulation of the ore-bearing solution through the Fortuna. If any of these junctions were still undisturbed by mining operations they would doubtless show important evidence in regard to age of veins and time of movement. The lower workings on this old vein are under water from a depth of about 500 ft., but accounts seem to show that it split up and was lost at the bottom. Near the present water-level is the open stope on the only vein worked below the Fortuna, called the Bee Hive 'dropper.' The Fortuna continues past this junction without apparent change, while the 'dropper' does not extend up farther. Reports show this orebody to have been bottomed in less than 200 ft. below the junction. As will be seen from this description, the probable sources of the ore-bearing solutions are concealed below the water-level in the old workings.

Most of the veins show a banded structure and displacements of the bands show several enlargements of the fissures since the primary deposition. A peculiarity of the ore is the occasional occurrence of manganese dioxide in vugs. The dioxide is loose and clayey in texture and carries some silver to the exclusion of gold. The best assays are usually found on or near one wall or the other, as indicated by fine scaly gouge or by small blue spots (of telluride) in the quartz.

MINING AND METALLURGICAL PATENTS.

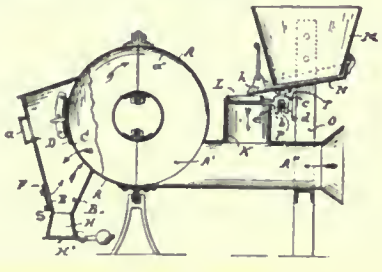
Specially Reported for the MINING AND SCIENTIFIC PRESS.

ORE DISTRIBUTER.—No. 855,744; Philip Argall, Denver, Colorado.



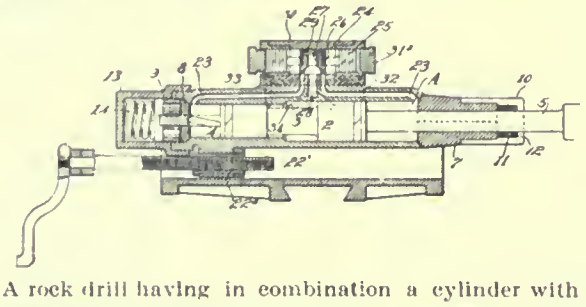
In an ore distributer, means for carrying pulverulent material to a required point, a conveyer mounted to receive said material as discharged, and to rotate angularly in a horizontal plane about said point of discharge, means to rotate said conveyer in said plane, means to cause a longitudinal travel of said conveyor simultaneously with said rotation, whereby the material is moved radially from the centre, and means connected with said conveyor for removing material therefrom during its outward travel.

CENTRIFUGAL CONCENTRATOR.—No. 852,558; Charles T. Heisel, Cleveland, Ohio.



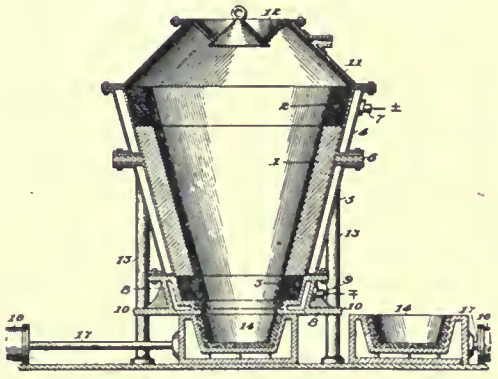
In a concentrator the combination of a helical conduit, a feeder therefor, suitable means for forming compartments at the side of the conduit having openings leading from the outer air into the conduit, means to vary the size of conduit openings, means to regulate the size of the outer air openings, means near the terminal of the conduit to induce an air-current therethrough, and also through the side compartments into the conduit through the outer air openings and the conduit openings for the purpose of regulating the discharge of the material into said side compartments.

ROCK DRILL.—No. 853,555; Edward Leichter, Nevada City, Cal., assignor of one-half to James C. Campbell, Nevada City, California.



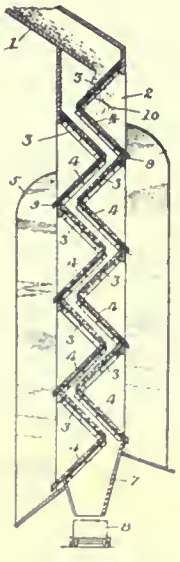
A rock drill having in combination a cylinder with tapered seats at the ends, a piston, front and rear heads having corresponding conical portions to fit said seats, the rear end of said cylinder having an extension beyond the adjacent seat, a chambered bonnet inclosing the rear end of the cylinder and receiving said extension and having a limited sliding movement relative thereto and a spring within the chamber of said bonnet.

PROCESS OF SMELTING REFRACTORY ORES AND PRODUCING FERRO-ALLOYS.—No. 855,478; Edgar F. Price, Niagara Falls, New York.



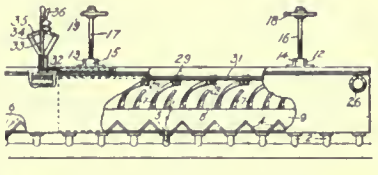
The process which consists in electrically smelting a charge containing a refractory ore, by means of an electrically-heated resistance-conductor, accumulating a body of the product, a portion of said body lying within a movable receptacle and a portion within the smelting chamber, and shifting the receptacle and thereby withdrawing its contents from the portion remaining in the furnace.

MINERAL-SEPARATOR.— No. 853,603; Charles U. Shepard, Summerville, South Carolina.



In a separator for granular material, means for supplying granular material to be treated, two series of screens located parallel to each other, and forming between said series of zig-zag path from the upper end to the lower end of the separator, the screens of each series being alternately of coarse and fine mesh, and a coarse screen of one series being located beneath a fine screen of the other series, so that the larger particles of the material are retained between the series of screens, and the finer material is discharged from the fine screens.

GOLD WASHER.—No. 855,640; Benaiah G. Jayne, New York, N. Y., assignor to Idanha Machine Company, a Corporation of New York.



In a gold washer or amalgamator the combination with a tank, of deflecting wings, means constructed to adjust the said wings, blades attached to the said wings and adjustable, also water-serving and jet-forming devices fashioned and disposed to discharge upwardly from the bottom of the tank toward the lower edges of the wings whereby the sand and water are deflected outwardly.

The Edwards Furnace.

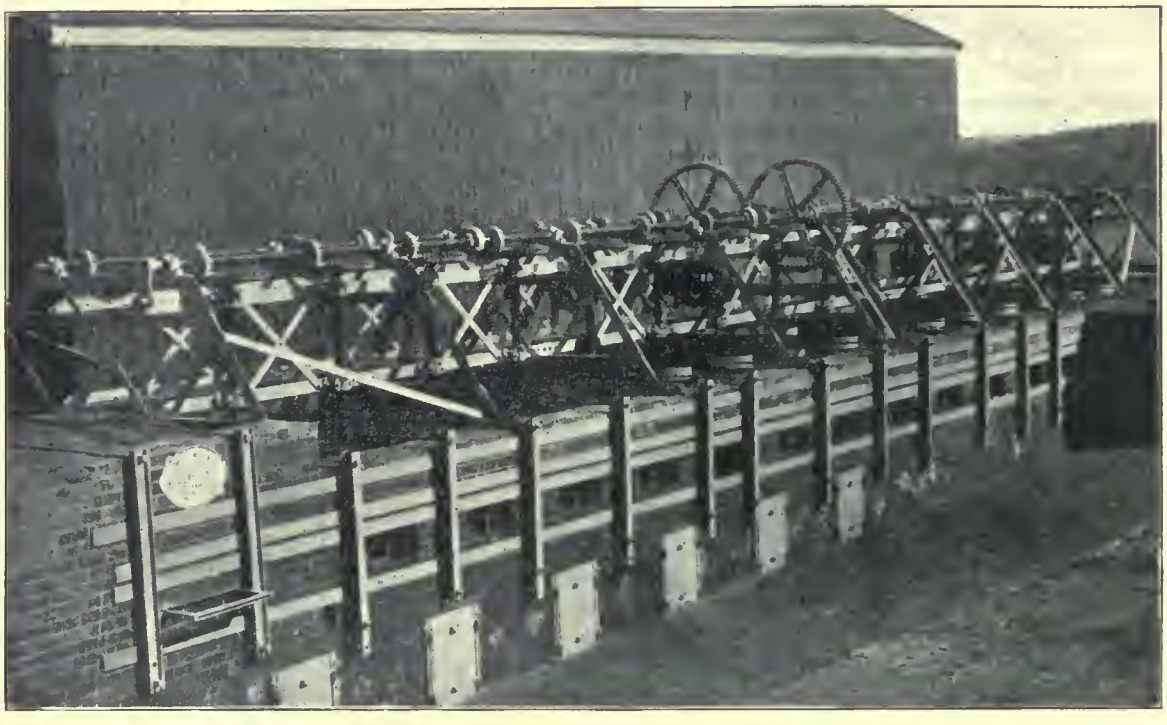
This furnace is now established in most of the States where refractory ores have to be cheaply and effectively roasted. It is operating on gold, silver, copper, zinc, lead, arsenic, cobalt, nickel, and other ores, and has proved a highly successful furnace for the treatment of sulpho-tellurides at Cripple Creek, having shown a saving of 50% in fuel and in operating costs as compared to other types of roasters. The roasting of the Cripple Creek low-grade ores cheaply and effectively, to enable good extraction in connection with modern methods of cyaniding, will increase the local gold production, as any mine can be furnished with its own individual equipment.

There are several types of Edwards roasting furnace, known as the tilting type, the simplex, and duplex, along with two other designs. One feature of these roasters is the fact that they can be arranged and erected to suit any particular problem in the roasting of a refractory ore. Four duplex roasters have recently gone into commission at the new Golden Cycle mill at Colorado City, and each furnace handles 100 tons of ore per 24 hours, giving a calcined product carrying about 0.008% sulphur. The power required amounts to about 5 or 6 h.p. The product is amenable to amalgamation and cyanidation. The tilting type of furnace is composed of two girders made in three sections. No single part of the furnace weighs more than 3,000 lb. Most of the parts do not exceed 250 lb. This furnace rests on pivots near its centre, and the output of the ore can be controlled by moving the furnace from the horizontal to any desired angle, thereby increasing or decreasing the discharge according to the refractory nature of the ore. The progress of roasting can be seen, and the action of the furnace is under the perfect control of the attendant; and a guaranteed sweet-roasted product is discharged in the best possible condition for chlorination, cyanide, or other treatment. It requires one horse-power to drive it.

The furnace is fitted with a series of iron rabbles, which rotate in opposite directions and are arranged to cut each other's circles. The spindles and feet of the rabbles are hollow, and are kept cool by a small constant flow of water passing through them. The connection with the main or stationary flue is effected by means of a frame having grooves, in which a thin plate of iron is moved up and down by the action of the furnace, thus covering the oblong opening and excluding the cold air from the flue; the frame is bolted to the flue.

The duplex furnace is a stationary structure, having a double series of rabbles, so as to treat a large tonnage. The rabbles are arranged to stir the ore at high temperatures as in the tilting type; this method of rabbling is effective in exposing all particles of ore to the action of heat and oxygen. The rabbling mechanism is supported and carried on the top of the furnace, all being firmly held in position by angle-iron brackets.

The wear and tear on these furnaces is exceedingly small, and the design is such that any repair can be rapidly effected. Any fuel may be used, as the furnaces can be heated with coal, producer-gas, or wood. One-half the fuel used in the hand-worked furnace is sufficient to roast the same quantity of ore in the Edwards furnace where the sulphur is utilized as fuel. This furnace is easily installed; the only foundation required is one small block of concrete under each pivot, and it requires 10,000 bricks to line it. It can be easily taken down and transported to any other locality.



The Edwards Roasting Furnace.

Trade Treatises.

ALLIS-CHALMERS CO., of Milwaukee, Wis., has published Bulletin No. 1,609, from the pumping-engine department, containing official duty-tests of pumping engines at Bissell's Point pumping station of the St. Louis water works.

THE ARTHUR KOPPEL CO. have issued an album containing a fine collection of photographs of various installations completed by this company at home and abroad. The views are grouped under geographical divisions, namely Europe, Africa, Asia, Australia, and America. The text of this publication is printed in German, French, English, and Spanish.

THE MCLAUGHLIN MANUFACTUING CO. issues an attractive catalogue on steam tractors. The new plant of the McLaughlin company is situated in the manufacturing district of West Berkeley, Cal. Their steam-traction engines are built on the designs of John McLaughlin, who has long been interested in the development of this class of machinery. They are now building powerful traction engines designed for the severest kinds of mountain and desert work and these will be employed in ore-hauling, logging, farm cultivation, and general freight. One of the attractive features of these engines, aside from their general efficiency, is that all of their parts are perfectly interchangeable.

Editorial.

WITH THIS ISSUE, our subscribers will receive the index for the volume that covers the first six months of 1907. The punctuality in delivery of this index bears testimony to the harmony between the editorial, composing, and printing departments of this journal.

THE THIRTEENTH ANNUAL MEETING of the Lake Superior Mining Institute will be held on the Minnesota iron ranges, beginning July 24. Among the subjects to be discussed are mine sanitation and ore sampling.

IN THIS ISSUE the column usually devoted to the 'Prospector' is given to a short biographical sketch of the late Henry G. Hanks. He was a good friend to prospectors and miners, and they will not begrudge the space given to so worthy a memory.

FURTHER DISCUSSION on the relative merits of the reverberatory and the blast-furnace appears in this issue. Mr. James W. Neill, who started this useful debate in our columns about a year ago, returns to the charge with a number of pertinent observations and some valuable figures. We shall be glad to publish the views of other copper metallurgists.

TUNGSTEN is in demand. In California the only recorded shipment during 1906 was a ton of concentrate made from 15 tons of scheelite ore, at Paris, in Kern county. In Nevada, Round Mountain is yielding tungsten. Last week a shipment from this district in Nye county was received at Denver from the Monster mine. This carried 30 per cent tungstic acid and was worth $292 for 1,948 pounds of concentrate.

NONE of the bulletins of the United States Geological Survey will be more welcome than No. 287, which gives an account of the Juneau Gold Belt by Arthur C. Spencer. This covers the geology of the Alaska-Treadwell and adjacent mines on Douglas island, as well as other districts in southeastern Alaska. The Territory of Alaska has become a great mining region and in its development it has received invaluable aid from the scientific departments of the Government. The series of reports and bulletins on various parts of Alaska published by the Survey now constitutes a body of literature of astonishing breadth of treatment, practical usefulness, and scientific value.

MEXICO AND SAN FRANCISCO ought to be united by water transport of the best kind. It is stated that the Mexican Government has offered liberal inducements to the Vanderbilt system of railways to divert their traffic over the National Tehuantepec Railroad, and to estab-

lish a line of steamships between New York and Coatzacoalcos at the Atlantic end of the Tehuantepec railway, and between San Francisco and the Pacific terminus at Salina Cruz. Such an arrangement is much to be desired. Eventually even more direct communication with the City of Mexico and the central plateau ought to be established by a steamship service calling at the port of one or more of the railroads now in course of construction across the mountains that have so long separated Central Mexico from its coastal plain on the Pacific slope.

CHILE is likely to become an important source of copper within the next five years, that is, when methods of transport are sufficiently improved. The Braden Copper Company is building a narrow-gauge railroad from its concentrator at the Fortuna mine to Rancagua, a distance of 73 kilometres, and it is likely that this railroad will be continued to the Coast, where the smelter is to be erected. The Mining Exploration Company has built 70 kilometres of traction-engine road from Tinguiririca to the smelter site and has material ordered for 53 kilometres, of 60 centimetre gauge, from the smelter to the Choicas mine, which is on the eastern slope of the Andes, in Argentina, and at 10,000 feet above sea-level. A French company has taken hold of the Naltogua mine at Melapilla, in the Coast range southwest of Santiago, and is doing good work under the management of Mr. H. B. Hall, formerly with the Copiapo Company. These notes are indicative of the activity in Chile, and the probability that this South American republic will regain the importance in copper mining that it held a generation ago.

COMMUNICATION BY WIRE is almost cut off by the strike of employees in the service of the two telegraph companies, so that this week our market reports have suffered. The rights and wrongs of the quarrel are involved, but it is not likely that either of the companies will get much sympathy, having regard to their behavior during the time of the earthquake disaster. The Western Union Telegraph Company ought to have lost its franchise and ought to have been indicted for misappropriation of funds in April 1906, for at that time thousands of messages were taken, and paid for, which were not delivered, that is, the telegraph officials accepted money, ranging from 25 cents to dollars per telegram, for messages that they never delivered or else forwarded eventually and tardily by letter postage, the latter costing two cents. It is a curious fact that, beyond an ineffective resolution of the Grand Jury, nothing was done, then or since. It is to redress such wrongs committed against the public that Senators and Representatives are elected and it is disgraceful that the matter should never have been investigated, with proper punishment to follow. What we need is a Citizens Protective League to remedy such evils and compel irresponsible corporations to obey the law, under penalty of loss of the privileges given to them by the community in the interest of that community and not as a license to commit depredations in order to pay dividends on heavily watered stock.

NUMEROUS ARRESTS and indictments for misuse of the mails for fraudulent mining give testimony to the efficiency of the postal inspectors. We hope that the Post-Office Department will continue its useful work, for this is a greater deterrent to fraudulent mining than all the resolutions of mining congresses or the bills brought before legislatures, simply because it represents the enforcement of laws already on the statute book. In one case two mining engineers in good standing are arraigned and if they are guilty we hope that an example will be made of them; if they are not, they will do well to explain their action without loss of time. Our columns are always open to members of the profession when unjustly accused or improperly implicated in the affairs of promoters. In a recent issue we were glad to publish the disclaimer from Mr. A. J. Eveland, whose name had been used wrongly in the promotion of mines, or alleged mines, in the Phillipines. By his letter Mr. Eveland made his position clear before the profession, and if an engineer's record is clear before his profession, the opinion of the public, and especially the daily press, is of small account.

A Fundamental Problem.

DURING the past week we received a letter from a firm of brokers, asking for advice. It appears that the firm, consisting of two men, had endeavored to conduct an honest business in the promotion of mining property; the aim had been to acquire prospects and to develop them into productive mines, with no attempt to make a profit by selling stock or by any of the other questionable methods usually adopted in such cases. Prospects were purchased at the lowest prices and the management of operations was made as little expensive as possible. Out of five prospects, three proved worthless and were soon abandoned. On the other two about $65,000 was spent, under the advice of men that were believed to be competent. Finally, two mining engineers of experience were engaged and they have united in saying that the outlook for the two remaining prospects, now young mines in the extent of their workings, is hopeless. The brokers, one of whom writes to us in obvious good faith and gives these data, want to know where their methods were wrong and how to better them, in their own interest and in that of their clients. They complain that it is difficult to get an advisory engineer to give advice that is explicit and to the point. In any other form of industrial enterprise, it is possible to employ experts that will give concrete advice as to what to do and when to do it. Is mining only a gamble after all?

Perhaps one or other of our readers will be able to answer this question and give advice to these seekers after knowledge. We confess that it makes us feel ignorant when such fundamental queries are propounded. In the first place, undoubtedly, there is luck in mining; it is true that the most skillful and careful of men may be unsuccessful. As to prospects, they are like babies, their future is uncertain, even with the best of pedigrees and

the most favorable of environments; so a hole in the ground, even with a good-looking vein and a nice streak of ore, may 'go skat,' as the Cornishman says. A hungry looking trench may be an infant bonanza. The prospect next door to a great mine may prove no richer than the one that is miles away from anything with a record. This uncertainty is part of the charm of mining and it is an essential factor in speculation. But we try to minimize it, as we endeavor to eliminate uncertainties in all forms of industrial enterprise. The purely accidental element in the problem is overcome in part by securing the advice of experienced men, of those with local knowledge, of those credited with unimpeachable integrity. In many cases the best advice is not obtainable because the cost of it is fully equal to the price of a prospect; but most operators forget that the first cost is a small part only of the total expenditure. A prospect that costs $5,000 or $10,000 may have $50,000 or $100,000 expended upon it, before it is abandoned or proved to be a real mine. Thus costly advice, if good, is cheap in the end. Next, we allow the complaint that engineers often fail to be explicit, that is, they hedge; not being willing to endanger their reputation, they are apt to deal in generalities and give a report that will be fairly well verified no matter what happens. Here we take sides with the broker against our own profession. There is ground for complaint. An engineer is paid a fee to tell the truth fully and plainly; if he does not express a frank opinion and give his client the full benefit of his honest judgment, he fails "to deliver the goods" and he is unprofessional—which ought to be a severe term of reproach. If one man is paid $5,000 and another $500, it is not because the physical fatigue or mental labor involved in the inspection of a mine is less for one than the other; the larger fee recognizes the bigger reputation and is testimony to the fact that the engineer of acknowledged standing has more to lose by making an error than the other man, who may not have won his spurs. If then the $5,000 man hedges or reports in ambiguous terms or understates the ore reserves, he is not fulfilling his contract, which is to give his client the full benefit of his knowledge. On the other hand, it is likely that our friend the broker engaged local talent, that is, mining men interested in the development of the district, desirous of seeing money invested, sanguine as to the future of their own habitat and prone to see things through rose-colored spectacles. In boom camps the man of independent judgment is labeled a 'knocker'; to the enthusiasts around him he is but a poor pessimist. He is not likely to be engaged by a promoter, who naturally belongs to the most hopeful portion of humanity, whose geese may become swans, whose lame ducks may soar into the empyrean. It is a fact that if brokers with an honest purpose—to mine in the ground and not in the pockets of the public—do not turn to the better class of engineers in a mining camp, it is because they suspect the connection of such experts with some big corporation and they fear to risk their money and that of their clients in playing into the hands of such powerful organizations. This may sound silly, but it is one of the difficulties of the case. Most of the successful engineers are retained by, or have affiliations with, capitalists or groups of capitalists. Such a connection may either interfere with plain dealing or it may prove of assistance in the promotion of an enterprise, but it introduces another perturbing factor.

Therefore, the best advice we can give our correspondent the broker is not to put his eggs in one basket, not to depend for success on one prospect, but to try his luck with several. In the case mentioned, the number was five and that seems to have been enough for the capital available. Next, get good technical advice. If you cannot pay for it, stay out of the game. The excellence of the advice may be measured by its costliness, but not necessarily. Do not go to the mining engineers that are financiers, able to play their own game and that of rich clients, but rather choose the type of man that has been a mine manager, that has had more than a local experience, that is willing to express his judgment frankly, that makes your interests his own as long as you employ him. In the end, we find ourselves curiously in sympathy with the broker in search of a trustworthy technical advisor; nothing would aid well-intentioned speculators in mining, such as he, so much as the increase in the number of capable, honest, and independent mining engineers, not of the 'famous', 'distinguished', and 'well known' class, but just sensible and trustworthy fellows, able to give advice and willing to give it for a reasonable fee. The desire of this broker is the hope of our profession.

OUR LONDON CORRESPONDENT refers to the fact that Messrs. C. A. Moreing, H. C. Hoover, and a number of engineers associated with the firm of Bewick & Moreing have resigned from the Institution of Mining & Metallurgy. The matter has provoked much comment and it is altogether regrettable. We are informed that the resignations are due to offense taken by Mr. Moreing because he was not selected to represent the Institution on the governing body of the new Imperial College of Technology. While, as an ex-president of the Institution and a most successful mining engineer, he was well fitted for the appointment, it so happened that Mr. Walter McDermott was also nominated and as he had done most of the work of the Departmental Committee and was largely credited with obtaining recognition for the School of Mines as a separate body, he was chosen to represent the Institution. There may be other reasons for the resignations. It is known that Messrs. Moreing and Hoover have had some differences with the Council of the Institution previously, otherwise such wholesale resignations could not have occurred. Into the merits of the quarrel we cannot go. Among those that have resigned are several first-rate engineers and Mr. Hoover we consider one of the men best worthy of representing the application of the American idea to English mining enterprise. During the past year or two, the Institution has gained strength rapidly by reason of doing good work and it has become a real power for good. We hope that the incident will not be closed without some effort to restore harmony.

Personal.

J. W. MERCER is at Denver.

F. L. BOSQUI is at Goldfield.

LEWIS T. WRIGHT is at London.

GRANT H. SMITH, of Salt Lake, is here.

CHARLES BUTTERS has returned from London.

W. BLACKMORE is examining mines in Norway.

O. B. PERRY has gone from New York to Alaska.

FRANK KLEPETKO has opened an office at Lima, Peru.

R. H. CHANNING is on a visit to New York from Peru.

F. F. SHARPLESS has been examining mines in Idaho.

STANLEY C. DUNN has returned to London from Egypt.

LESLIE HALL is on a visit to London from Western Australia.

L. H. L. HUDDART is on a visit to England from East Africa.

FRANKLIN R. CARPENTER, of Denver, is in southern Mexico.

F. H. MINARD, of Denver, has been inspecting mines in Ontario.

S. H. BROCKUNIER, of New York, was recently in San Francisco.

FORBES RICKARD is examining mines at Central City, Colorado.

J. M. HYDE has returned to San Francisco from Guanajuato, Mexico.

WILLIAM BRADEN is expected at New York, from Chile, about July 15.

J. H. CURLE has been in Newfoundland. He is now on his way to Salt Lake.

C. W. GEDDES is making an examination of the Goldfield Consolidated mines, in Nevada.

ALEXANDER LEGGAT has retired from mining practice to become City Engineer of Butte.

ROY H. CLARKE, of Spokane, has been examining mines in the Oro Blanco district of Arizona.

L. H. DYKE has joined the staff of the Zaruma Mines Co. in Ecuador. He left San Francisco on June 15.

W. F. THORPE is directing the construction of the mill of the Veta Colorado Mining Co., in Chihuahua, Mexico.

EARL R. PEMBROKE has returned to Salt Lake, having examined mines in the Good Spring district of Utah.

GEORGE J. YOUNG, professor of metallurgy in the Nevada State University at Reno, is on a visit to San Francisco.

T. A. BUDD, of Buffalo, N. Y., who is operating mines near Walker lake, in Nevada, was in this City last week.

J. P. GAZZAM is at New York. He has resigned as general manager for the Nevada Consolidated Copper Company.

GEORGE D. BLOOD, of Salt Lake, has been engaged in professional work for the Silver King Coalition Mines Co. at Park City.

THOMAS COX, mine superintendent for the Nevada Con. Copper Co., has left Ely to accept a position with the Cerro de Pasco Co. in Peru.

POPE YEATMAN is now in entire charge of operations at Ely, for the Nevada Consolidated Copper Co. and the Steptoe Valley Mining & Smelting Company.

L. VOGELSTEIN & Co., New York, give the figures of German consumption of foreign copper for the months of January to April, 1907, as follows:

	Tons.
Imports of copper	39,059
Exports " "	2,834
Consumption	36,225
As against this same period in 1906 of	38,804

Of this amount, 31,103 tons were imported from the United States.

General Mining News.

ALASKA.

NOME.

From the amount of preliminary work being done in the Council district preparatory to the opening of the summer season, it is evident that the district will be exceedingly busy during the next three months and will be a heavy producer. The dirt that was hoisted last winter has all been sluiced up, and everyone is looking forward to surface mining.—— William West has a force of men at work on the big ditch of the Wild Goose company.——The Blue Goose Mining Co. has its dredge running on Ophir creek.——Nick Obrodovich has just finished washing a $9,000 dump on No. 10 Ophir, which he has been working on a lay from the Wild Goose company.——R. E. Grinnel, superintendent for Ed. Dunne, has commenced ground-sluicing with two giants. The laymen operating on the ground of the Ophir Hydraulic M. Co. have washed up the winter's dump, with disappointing results.

Throughout the Kougarok district there is much activity, and the summer season will see a great advancement in this part of the country. The ditch company is especially busy getting the waterways into shape. The ground on Coffee creek and in Wonder gulch is showing up strong, and a new town will probably spring up at the mouth of Henry creek.

William C. Slade, who has been at the Inmachuk all winter for the Fairhaven Ditch Co., has left Nome with 120 men to finish the big ditch. A large dump has been extracted on the Utica group, owned by the Fairhaven company, and prospecting is being done in a number of places along the Inmachuk river, and several hydraulic elevators are being installed. —— Candle is having quite a boom, and everyone who had a lay seems to have struck pay-dirt. The snow left the northern country early this year, and was all gone on the Inmachuk by May 7. A. G. Blake has been surveying the Inmachuk coal mines for patents, and ran a line for the projected electric road. The mines are proving profitable and 40 men are employed. Around Nome, water is scarce on many parts of the tundra and many operators have not been able to wash up their dumps until the water is turned into the big ditches, which was done about June 26. It is impossible at this time to do any freighting over the roads, except those kept in condition by the Alaska road commission. The unexpectedly early break-up and run of water in the numerous creeks and gulches crossing the third beach line gave a great impetus to sluicing and cleaning up, earlier than in any previous season, and the strip of ground between Newton gulch and Little creek has been a busy place. Among the most prominent camps are: The North Pole fraction, worked by Lindsay and Murray; Bon Voyage, worked by Crabtree, Harding, and Waskey; the Wild Goose camp on No. 4 Newton; the Duplex fraction; Bear Cub, worked by Adams & Ashley and Christiansen & Olsen; Tidal Wave, worked by Tom Donahoe; Tom Doyle's camp, where $300,000 will probably be cleaned up; Diamond L., worked by Sam Samson; the Gertrude, worked by Doyle, Cole, and McCrea; the Cyrus Noble and Captain Sunback ground; the Bessie bench claim, operated by Denhart, Nixon & Bard, which is one of the richest on the third beach-line; the Mabel claim, the Pioneer company's ground, and hundreds of other camps that have good dumps and are already sluicing.—— The injunction order in the case of the Colorado & Cape Nome Mining Co. *v.* Graham et al., has been modified and the defendants will be allowed to wash up the dumps lying on the Philadelphia fraction, on the third beach-line.—— The ground on Shovel creek, that has been worked for two years by a dredge, will be exploited this summer by Charles Hedberg and John A. Webb. ——A large dump has been taken out on the first beach-line, on the Violet group just west of Snake river by McLain, Venberg, Tuftager, and Alberg. Bedrock is only 12 ft. below the surface.

ARIZONA.

COCHISE COUNTY.

A new road has been completed from Cabullona station on the Nacozari railroad to the Santa Rosa mine, 15 miles south of Douglas. New hoisting machinery has been ordered, and the property is looking well.

During the past week, good ore has been struck in the Irish Mag workings of the Calumet & Arizona, on the 950-ft. south level. The ore is said to run between 8 and 15% in copper.—At the Oliver, the new electric pump is about ready to start. It will have a capacity of 600 gal. per min. at a depth of 1,200 ft.——The bids are all in for the erection of the Shattuck & Arizona smelter. At the mine, the drift on the 900 level, at 75 ft., ran into a body of sulphide ore, which ran about 4% The payroll contains 225 names, and about 300 tons of ore are shipped daily.——At the Hoatson shaft of the Superior & Pittsburg, the work of cutting the station on the 1,200 level is progressing rapidly. A station is being cut on the same level in the Junction, where a relay pumping-plant will be installed.

MARICOPA COUNTY.

In the Cave creek district there is a good deal of activity. The Grand Traverse & Arizona company has a shaft down 60 ft. and a contract has been let for 100 ft. more. On another claim it has a 325-ft. shaft, with some copper showing. C. F. Smurthwaite is the superintendent. This company is composed of Michigan people.——The Kentucky-Arizona company is developing its ground, and has a good equipment. R. T. McCullough is its representative.——A shaft is down 500 ft. on the Mormon Girl mine, and drifts have encountered ore, but work has been suspended for two months.

MOHAVE COUNTY.

Regular shipments of copper ore are being made by the St. Charles Brothers, from the Midnight mine to the Humboldt smelter.——Work is progressing on the Nonpareil and other claims near the old McCracken mines.——The Gem and Vanderbilt mills at Cerbat are running steadily, producing bullion and concentrate. Some shipping ore is produced by these mines.——The Berkeley mill is running and producing a good grade of concentrate. As soon as the mine has been pumped out, a better grade of ore will be stoped. ——W. H. Corbier has a bond and lease on the Kemple mines, in the Weaver district. Shafts will be started at once.——A large flow of water has been encountered in the shaft being sunk on the Pleades mine, at Cerbat. J. T. Davis is in charge of the work.——W. A. Mensch has arrived at Kingman, and will start the development of mines in the Enterprise camp, especially the Le Roi Copper Co.'s property, adjoining the Enterprise.——The officers of the Benedictine M. & M. Co. have recently visited the company's property, which is the Arnold group of claims. Sinking will be resumed at once.——Engineers are examining the old McCracken mine, west of Signal, for Chicago people.——The Onita mines, north of Williams, owned by the Tawa Developing Co., have been leased to the Humboldt smelter people. This company is also operating the mines east of Hackberry, under bond from Tomlinson & Brown. ——Some good ore has been found on the 300-ft. level in the Catherine mine of the Pyramid group. A cross-cut is being run on the 400 level to cut the same orebody. Lewis Hofer is the superintendent.——Newton Evans reports the sale of the Signal Copper Co.'s holdings in the Bill Williams Fork region, to New York people.——The Expansion Mining Co. has its compressor in operation and is making good progress with machine-drills in the big tunnel.——As soon as the Cupel mine is unwatered the shaft will be sunk by the Stockton Hill Mining Co.——It is reported that Epps Randolph has taken a bond on 25 copper claims in the Cababi district.

PINAL COUNTY.

The capacity of the Big Lead mill near Kelvin will be increased from 50 to 150 tons per day. Both the Big Lead and the Kelvin reduction mills are running to full capacity and shipping concentrate to El Paso. The Big Lead and Calumet companies have consolidated and the new company will be known as the Kelvin Calumet Copper Co. W. E. Sharps is the manager for the Big Lead company. ——The narrow-gauge railroad from Kelvin to Ray is nearly finished, and the 200-ton concentrator being built at Kelvin by the Ray Copper Co., will be running within 60 days.——The Arizona-Hercules Copper Co., headed by W. P. Dunham, is doing extensive development work.

YUMA COUNTY.

The camp of Salome is lively. The Harqua Hala now has 20 stamps working on ore from the Golden Eagle claim, and has completed a tramway from this claim to the Harqua Hala. The company employs 75 men, and 20 stamps will be added to the mill.—— The South Cholla Development Co., backed by Chicago and Los Angeles people, is putting down a 500-ft. three-compartment shaft. A new air-compressor will be installed within a month.—— Los Angeles people have purchased the White Steamer claims, the Big Four, and others in the same belt.—— The Putnam & Dresser property has a shaft down 350 ft.—— West of Salome, the Ironwood & Arizona company employs 15 men, and has a shaft down 260 ft.—— On the old Bullard property, in Cunningham pass, 30 men are at work, and a carload of ore per week is shipped.—— The Copper Whale group of claims has been sold to New York people and work has started.——At the Ora Cobre, joining the Copper Whale, the shaft is down 240 ft. and shows ore in the bottom.——At the Clara, or Carrigan property, a contract has been let for 100 ft. of work on the vertical shaft.

CALIFORNIA.

AMADOR COUNTY.

The old Treadwell mine is being opened by the Sutter Creek G. M. Co. This property, which is situated on Sutter creek, near Volcano, once produced rich ore, but the vein pinched out. A new cross-cut is being driven, under the supervision of John Hall, some milling ore has been encountered, and the five-stamp mill will be started.

CALAVERAS COUNTY.

About 300 men are working at the Goatranch mine at Keystone, operated by the Nassau Copper Co. At the 200-ft. level stoping is proceeding, and the ore is hauled to Angels.——The strike and lockout in the mines of Angels Camp still continue and there is no settlement in sight. Many miners have left the camp.

NEVADA COUNTY.

There is quite a revival of interest in mining in the Washington district, especially on Canyon creek. The Mountain View mine, managed by E. B. Miller, is again running, and the three-stamp mill is in operation.——Ed. S. Brindle is running a cross-cut on his claim near the Ethel, and expects to strike the vein in 50 ft. more.——Fred Marcotte has purchased the five-stamp mill that was ordered for the Isis mine, and will erect it on his property.——J. W. Morrell is developing properties in the vicinity of Forest and Alleghany.——A strike was recently made in the Thornburg property, and the Del Norte-Scotia claims have been bonded by Crafts & Smith to T. E. Jameson, of Alameda. ——The 20-stamp mill of the Champion company is running continuously, and 120 men are employed at this property on Deer creek. This company has started sinking the shaft in the Home mine, which is already down 800 ft.—— A rich orebody has been struck on the 260-ft. level of the California mine on Deadmans Flat, in the south drift. The vein is from 10 to 18 in. wide and looks permanent. This mine was worked years ago, and has but recently been reopened by Grass Valley men.——The Olla, or McPherran mine, is being developed under the direction of A. Spotswood. The tunnel is in 500 ft. and will have to go 700 ft. further to strike the vein, which will give 300 ft. of back. ——Henry Kaler has resigned as superintendent of the Gray Eagle mine at Maybert, and A. A. Charonnat is now in charge. Frank L. McPherson is foreman, and the mill has been started.

A new pumping plant has been ordered for the Kenosha Mining Co. There will be two Cornish pumps, with a capacity of 1,000 ft. in depth, driven by electricity, and a new electric hoist will be installed.——An important strike is reported on the Last Chance gravel mine, just beyond Canada hill. A bedrock tunnel was run 400 ft., a raise was run 60 ft., and the pay-streak of ore tapped. The property consists of 40 acres, and is owned by J. M. O'Hearn.

PLACER COUNTY.

Some good ore is being mined in the Rublin mine, near Last Chance.——The Alameda mine, in Sailor canyon, will be opened this summer.—— A. G. Head has let a contract for running a 150-ft. tunnel on the Dardanelles.—— G. Maloney is running a tunnel on an old quartz claim near Forest Hill.——The Rawhide company declared a 10% dividend this month.——L. C. Trent is running a cross-cut at Mineland, but has not yet reached the vein.——Much construction is going on at the Dairy Farm mine. A new compressor has been put in place and the new hoist is nearly finished. The shaft is down 600 ft. About 100 men will be employed.——The Northern California G. M. Co. is pushing work on the old Herman mine, also called the Barton. About 60 men are employed, and an addition of 30 stamps will be made to the old 15-stamp mill. The electrical equip-

ment is at Colfax, awaiting shipment to the mine. Next year, the company expects to add 60 more stamps, and sink to a depth of 1,500 ft. The parallel vein on the Schulz claim will also be developed. This company is composed largely of Pittsburg capitalists. Henry C. Carr is the superintendent.——The Washington quartz claim has been sold to L. A. Gross, for $10,000, and he will, in conjunction with E. W. McGraw, of San Francisco, tear down a 20-stamp mill in Amador county and erect it on this property. ——The Excelsior mine is being put in shape and the 10-stamp mill will be operated this summer.——The Trinidad mine, south of Cisco, will be worked this summer.—— The Lost Emigrant mine has been bonded, and a 10-stamp mill will be erected on the property.—— W. S. May will erect a 30-stamp mill for a Pittsburg company, 18 miles above Forest Hill. A 500-h.p. steam-plant will operate the mill and a 200-kw. generator and two air-compressors will be installed.

The Lost Emigrant mine near Summit will be opened as soon as the snow melts. W. H. Bray and associates will put up a 10-stamp mill.——There is a force of 50 men work

California.—Showing Position of the Counties.

ing at the Herman mine. Sites for the sawmill and quartz-mill are being prepared.——The new tunnel at the Eureka is through the rim, but has not reached the bed of the channel. ——The tunnel at the Hidden Treasure is being run through the reef, and is expected to open the old blue lead.——Work is progressing on the tunnel of the Rawhide.——More men will be put to work on the Golden Scepter mine, near New England Mills. F. Ephraim is in charge.——W. A. Freeman will run the Black Hawk tunnel 75 ft., to the channel. ——N. E. Davenport is developing a vein on the Lillibridge property.——Fred. W. Snyder has made a good strike on his property in Black cañon, above Forest hill. Sample shipments have been made to the smelter.

COLORADO.

CLEAR CREEK COUNTY.

(Special Correspondence).—The strike reported last week in the Sydney adit of the East Argentine M. & M. Co. has proved better than at first supposed. There is a streak of lead ore three feet wide, with 50 ft. of mineralized quartz between walls, much of which is concentrating ore. The company owns a fine water-power and millsite and can erect a mill near the mouth of the adit which could be run at low cost. The cost of hauling the concentrate to Georgetown should not exceed $1 per ton. C. L. Cuist is the mine manager.——In cleaning out the upper workings of the Maud S. property, on Douglass Mtn., a good body of pay-ore was discovered on the hanging wall of the lode. The drift is now being pushed ahead on an eight-inch streak of ore. Shipments of ore from this property when previously worked returned 600 oz. silver per ton.——Shipments are being made from the Cashier on Douglass Mtn. to the Newton mill at Idaho Springs for concentration. The crude ore contains 19 oz. silver per ton with 40% lead and 34% zinc. L. G. Shepard of Georgetown has a lease and bond on the property.——C. W. Benkleman & Son of Denver have taken a lease and bond on the Nabob mine at Silver Creek. A drift is now being run on the Nabob lode to the east and a 12-in. vein of good silver-lead ore has been opened up.——The Prudential M. & T. Co., whose property is situated on Republican Mtn. with the portal of the Prudential adit within the town limits, is steadily driving the adit and will erect an air-compressor plant to operate machine-drills in this adit, and also its Montgomery Ward adit, situated about 1,000 ft. higher up the mountain, and being driven in the same direction as the Prudential, a little south of west, to cut the extension of the famous Pay Rock lode which has produced over $3,000,000 in the past. Wm. C. Hood is the manager.——Arrangements are being made for continuous shipments from the Santiago mine in East Argentine, over the Argentine Central R. R. Wm. Rogers, the manager, has made arrangements with the Waldorf Mining Co. for an electric-power line to the Santiago to enable him to operate electric drills. As there is ore blocked out in the mine, the output should average 25 tons per day.——The Silver Cloud on Sherman Mtn. is putting out ore which carries 35 oz. silver per ton. J. W. Olds, the manager, is sinking a winze on the ore-shoot from the Victoria tunnel-level.

Georgetown, June 21.

TELLER COUNTY.

(Special Correspondence).—Thos. Kavanaugh & Co. has a lease on the Wild Horse mine, on Bull hill, and is handling 800 tons through the cyanide plant. They are taking high-grade material from the lower levels, which is being shipped direct to the Golden Cycle mill at Colorado Springs. The mill at the mine is not equipped for handling this high-grade material, and it would not pay to remodel the mill for the amount they are taking out. The mill is dry-crushing, and the ore requires wet-crushing machinery. The mill has been operated at a profit on the ore which they are able to handle. A number of sub-lessees are taking out ore on the Wild Horse.—— The W. P. H. M. & L. Co. is operating a lease on the west end of the W. P. H. claim. The shaft is down 350 ft., and over 2,000 ft. of drifts are open. A. B. Whitmore, the superintendent, states they have a body of oxidized ore, that runs $6 to $9, that is over 200 ft. wide. The company is erecting a 100-ton mill for handling the ore from this mine, as well as working the dumps of the Jerry Johnson mine, on which they have a lease. The mill is being constructed by Groch & Woodard, consulting engineers, of Cripple Creek. They have been delayed on account of deliveries of material, but hope to be running before August 1. The company has 15 acres in the lease.——The Jerry Johnson expects to declare a dividend of one cent shortly. This company owns 41 acres on Iron Clad hill and is free from debt, and when a dividend is declared they reserve $10,000 in the treasury.——The Isabella mill, of which Geo. D. Kilbourn is the manager, is understood to be a success financially. This mill is handling some of the ore from the Isabella mine, but a majority from the dumps.——The Phœnix Leasing Co. is handling 100 to 150 tons per day through the Homestake mill, mostly custom ore. The mill has a daily capacity of 800 tons. John A. Johnson, the manager, believes they will soon be running full capacity. But three men are employed to do the work in the mill. Everything is automatic and handled by machinery. They turned out a brick a few days ago from four days' run weighing 140 oz. This mill has been operated at different times, but did not seem to be a success; but the present management feels much encouraged over the outlook.

Cripple Creek, June 19

NEVADA.

CHURCHILL COUNTY.

(Special Correspondence).—The Nevada Hills Co. has announced that the usual quarterly dividend of 10c. per share, or $75,000, will be paid this month. This makes a total of $225,000 in dividends for this year-old mine. A good strike has been made 660 ft. east of the developed portion of the mine, the ore running $100 per ton. In the older workings excellent ore is being extracted. The transportation problem is greatly hindering the shipments.——A strike has been made on the Golden Boulder, samples of the quartz running several hundred dollars per ton.—— Excellent ore is being taken from the Paymaster No. 4 claim of the Fairview Red Rock Extension. The ore runs about $50 per ton.——Good ore is being taken from the Knox lease, some of the ore assaying $500 per ton.—— Driving is in progress on the 75-ft. level of the Crosscut claim on the Red Rock. In the main shaft, good ore has been found. The surface and hoisting plant has been shipped, and is expected to arrive in a few days.

Fairview, June 14.

ELKO COUNTY.

(Special Correspondence).—The Tuscarora-Nevada Mines Co., capitalized at $12,000,000, has absorbed the following properties: Commonwealth, Grand Prix, Navajo, Independence, Queen, Dexter, De Freeze, and North Belle Isle. These mines have a production record of approximately $40,000,000, and have paid over $13,000,000 in dividends. The properties contain quartz veins and placer ground. The deepest shaft is down 700 ft. The company will sink several shafts to operate the mines at depth, while dredges will be used to work the placers. It is negotiating for several other properties, and a bright future seems to be in store for this famous old camp.

Tuscarora, June 22.

ESMERALDA COUNTY.

(Special Correspondence).—The Little Florence Co. has received $103,528 from the smelter for seven shipments of ore from the Red King claim of the Florence mine. The average value was $345 per ton and cost $35 per ton to ship and treat the ore. It is reported that the company will soon pay a dividend of 10c. per share, or a total dividend of $100,000.—During the past week 1,548 tons of ore were shipped from the Little Florence, Consolidated, Jumbo Extension, and Quartzite mines. Of this amount, over 900 tons were produced by the Consolidated mines.——On the Wedge Fraction claim of the Jumbo Extension four leasing companies are operating: Mohawk-Jumbo, Curtis, Higginson, and Mohawk Ledge. The claim is north of the Mohawk mine.——The Kalfus and Ish & Sheets leases, which were recently released from litigation, are preparing to resume operations. The Kalfus is regarded as the most promising lease in the entire camp.——The rumor that the Consolidated and Jumbo Extension were likely to be involved in litigation is denied by officers of both companies. Low-grade ore is being blocked out in the Gold Bar, and will be held until it can be handled at local mills. From the C. O. D. good ore is being extracted, and the lease of the working company will soon expire. It is not known whether the lease will be extended, or the mine operated by the owners, but it is understood that the lessees are desirous of continuing operations.——Some of the richest ore in the camp is being taken from the McNaughton lease on the Mohawk.——It is estimated that Goldfield has a population of 35,000. Rents are exorbitant and an adequate water supply continues to be an important problem.

Goldfield, June 23.

HUMBOLDT COUNTY.

(Special Correspondence).—The Tomboy property has passed into the hands of C. D. Bridges, of Memphis, and the plan is to operate the mine on a large scale. The Tomboy adjoins the Mazuma Hills, Vernon Fraction, Thor & Lizzie, and other properties.—— The shaft on the Fairview claim of the Seven Troughs group is down 359 ft. and will be sunk to a depth of 500 ft. On the Vernon claim the shaft is 60 ft. deep, and a cross-cut is being driven to reach the vein that was cut by the shaft.—— A 12-ft. vein has been struck in the 175-ft. tunnel on the Golden Treasure.—— At the Moler Buckhorn, the incline shaft is down 135 ft., and a 20-in. shoot of ore has been found. About 500 ft. west of the incline shaft, a vertical shaft is being sunk that will be the main working shaft.—— Several lessees are working on the Climax, and excellent ore is being extracted.——Good ore has been struck in the Silver Peak, and the vertical shaft is down 68 ft.——Two feet of quartz has been discovered in the Mazuma Hills, and some high-grade ore is ready for shipment. The mine is operated chiefly by lessees.——A tunnel is being driven on the Kindergarten Extension and will be run 400 ft. The mine is in the heart of the district.—— At the Kindergarten, three cars of ore are ready for shipment, and more is being extracted.—— Ore has been encountered in the Thor & Lizzie, and a new hoist is being installed. The shaft will be sunk to a depth of 300 ft.—— The Dingee Fraction company has refused an offer of $30,000 for the claim. The property contains less than six acres. Development work is under way and the claim is showing well. ——At the Badgers, owned by the Fine Gold Co., ore has been found, and shipments will soon be made.——Good ore is reported from the Eclipse, and it is thought the Mazuma Hill vein passes through the property.—— The shaft at the Tigers will be sunk 300 ft. Some good ore has been found. ——Truett & Monnette have installed a gasoline hoist on their lease on the Seven Troughs holdings, and will sink a shaft to a depth of 300 feet.

Vernon, June 20.

LANDER COUNTY.

(Special Correspondence).—Hodson & Colbath, of Salt Lake City, have purchased the Grand Victor group of four claims from Montgomery & Katterborn, for $30,000. The property adjoins the Gold Quartz mine, and contains an extension of the Biggs vein.—— The Uncle Sam group of four claims has been sold to Fred E. Bowman, of Denver, for $10,000. The claims adjoin the Bridal Wreath property. ——A short option on the Bridal Wreath has been granted to E. W. Smith and associates of Salt Lake.—— The Atlantic-Nevada Mines Co. has secured the Greyhound and Truckee properties. A shaft will be sunk to strike the Gold Quartz and Little Gem veins, which pass through the claims.——The shaft on the Phœnix is down 125 ft. from the surface, or 25 ft. below the tunnel level. The new hoist has been installed.—— A new hoist has been erected at the Gold Quartz shaft, and some good ore is being extracted. —The Little Gem is shipping 40 tons of ore per week, and much prospecting and development work is being done. A gasoline hoist, air-compressor, and pumping plant were recently installed.—— Good ore was recently encountered in the St. Lawrence and Anaconda claims, operated by the Lander-Tenabo Co. The vein parallels the Phœnix vein, but is gold, while the Phœnix vein carries silver and copper.——The shaft on the Two Widows is down 110 ft., with some high-grade copper ore in sight.—— A tunnel on the Dutch Oven property has opened up a vein of gold and copper ore.

Lander, June 21.

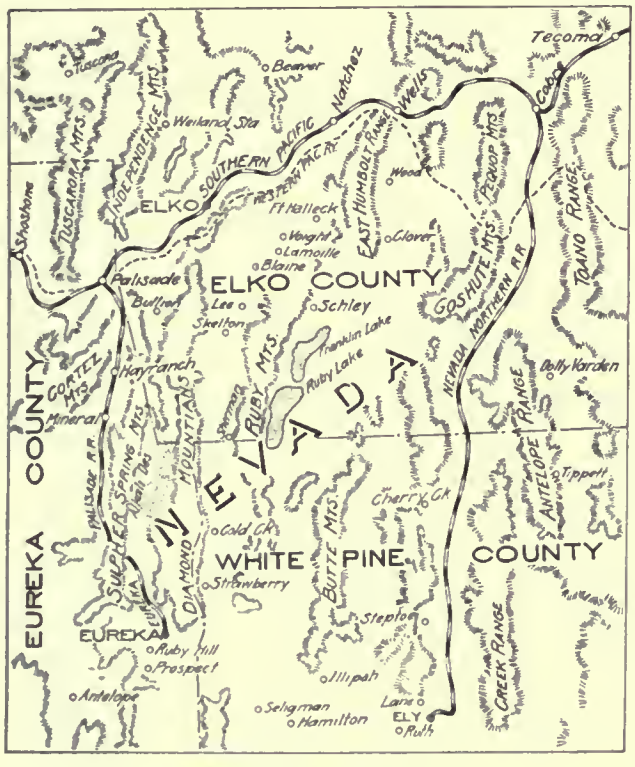
LINCOLN COUNTY.

(Special Correspondence).—Good ore has been discovered on the Spokane claim of the Searchlight Spokane Mining Co. This property was worked for a long time by the Southern Nevada M. & M. Co. The rich streak, which is six inches wide, was uncovered by A. F. Jennings, who has been in charge of the property. From El Dorado Canyon comes the news of a strike on the Black Hawk claim of the El Dorado Empire Mining Co. At a depth of 85 ft. in the east drift a body of ore has been encountered, the entire drift being in ore. At Nob Hill the Silver Legion, which has been operating but three weeks, since resuming in its shallow workings, has encountered an 18-in. streak of silver-gold ore running well. To date 50 tons of this rock has been sacked. The find was made on the 85-ft. level in the east drift.——Adjoining these properties the El Dorado Sphinx is opening up a body of milling ore, and has a two-foot streak of shipping rock.——A concentrating plant may be built on the Spinx. Water has been developed on a millsite on the Sphinx claim, within 100 yd. of the tunnel, and the mill will be built there.

Searchlight, June 20.

NYE COUNTY.

The annual meeting of the shareholders of the Tonopah Extension Mining Co. was held in Pittsburg May 20. The report shows that during the year ending in May, 4,637 ft. of development work was done, making a total of 14,250 ft. of development work. During the year the shaft was sunk from the 601-ft. point to the 972-ft. point, and 13,945 tons of ore were shipped to the smelter, giving a net return of $345,078. On account of the intrusion of dacite, 200 ft. thick, cutting through the vein below the 600-ft. level, shipments were curtailed, and the shaft is being sunk to the 1,050-ft. level, when cross-cutting will be started about the first of next year.——Shipments of ore from Tonopah during the week ending June 15, as reported from the Western Ore Purchasing Co., and the Tonopah Mining Co., amounted to 6,153 tons, divided as follows: To smelters, Tonopah Mining Co., 1,242 tons of ore; Belmont, 224; Extension, 220; Montana-Tonopah, 100; Midway, 37; Jim Butler, 30; West End, 40. To the mills: From the Tonopah mines, 3,190 and from the Belmont, 1,060 tons of ore.



Map of Eastern Nevada.

SOUTH DAKOTA.

LAWRENCE COUNTY.

(Special Correspondence). — The strike in Lawrence county, which affected all the mines in the northern hills except the Homestake, was settled on June 7 and the miners have resumed work. This strike commenced on January 1 and ran five months. The settlement was a compromise between the miners' union and the mine owners, and by the agreement just signed the men go to work for $3.20 for eight hours, and this agreement is to run for three months, when the old-time wages ($3.50) will be paid for an eight-hour day. The leading mines which were affected and which have now resumed work are the Mogul, Golden Reward, North Homestake (Maitland), Gilt Edge Maid, Golden Crest, Branch Mint, Wasp No. 2, and the Lundburg, Dorr, & Wilson, all of which employed about 700 men. The Homestake mine, which caught fire on March 25 and burned for a month, started flooding on April 22 and the fire was extinguished May 29, when the work of unwatering commenced. At present 600 stamps are dropping on ore taken from the large open-cuts, and from the upper levels of the mine, the deepest workings of which are 1,550 ft. There is said to be 100 miles of drifts, tunnels and shafts in the underground workings of the mine.——The resumption of work at all these mines has given quite a cheerful aspect to the towns of Lead and Deadwood, which for some weeks have been quite dull.—— In the central hills work is progressing on the Golden West and Montezuma at Rochford, and the Auburn mine at Mystic, besides a score of mines which are undergoing development.—— The Clara Belle Mining Co., near Oreville, in Pennington county, has not struck the rich pay shoot that they were sinking for, and which they left in the bottom of their old incline, although they have drifted about 500 ft. on the 250-ft. level, or the bottom of the new working shaft. They have encountered a good deal of low-grade ore in the drifts, but the vein they are running for goes $24 per ton in gold and is about seven feet wide, and they will probably strike it soon. The superintendent is Frank Hebert.—— The Holy Terror Keystone is about to be unwatered, and the main shaft, which is now 1,200 ft. deep, will be sunk. This mine has been a rich producer in the past, but has been tied up for years on account of litigation, which happily is now at an end. The mine has been leased to a company of which Chas. Morgan is president, R. H. McNulty superintendent, and E. A. H. Tays consulting engineer. The company announces its intention of putting up a mill of 100 stamps during the coming summer, but this announcement is considered premature. They have a good 20-stamp mill already.—— It has also been announced that John Truax and Gustave Mueller will commence work in a few days on their wolfram mines, which has an excellent showing of that mineral. ——The Black Metals Mining Co., of Hill City, is advertising that it is in the market to buy tungsten ores.

Custer, June 15.

WASHINGTON.

CHELAN COUNTY.

Developments on Chelan butte have increased the excitement at Chelan, west of Spokane. Kingman & Pershall claim is proving rich. The main vein is four feet wide carrying free gold, and through the centre runs a four-inch vein that goes high. Mr. Pershall has cross-cut the vein for 120 ft. So far, however, they have gone down only 18 ft. Other claims on the butte are showing up extremely well. S. Fourtner's original claim, the Jumbo, has produced ore said to be richer than that of the Kingman & Pershall claim, although the latter, so far, shows the best defined lode.

FERRY COUNTY.

(Special Correspondence).—A silver and copper-bearing vein on the Leonore group of five claims, on Manilla creek, has been opened by a 40-ft. shaft and about 700 ft. of tunneling. It is 28 ft. wide in the lower adit.—— The Central Mining Co. has spent over $16,000 in development of the Umatilla group of claims, and recently struck ore in the lower adit similar to that found in the upper workings.

Republic, June 22.

STEVENS COUNTY.

Shipments have been resumed from the property of the United Copper Mining Co., near Chewelah. The ore, which will be sent out at the rate of 15 tons per day, will be taken from the shaft until such time as the lower tunnel cuts the orebody.——Strikes of ore made recently on the Bella May claims in the Metaline district, north of Spokane, seem to establish the continuity of lead-silver orebodies in that part of northeastern Washington. Samples from No. 2 tunnel show 10% lead. Work has been suspended on the tunnel and a cross-cut begun. This will be run to tap the hanging wall on No. 3 level, after which a drift will be run to get under the drift on level No. 2. No. 3 tunnel will give a depth of 202 ft. below No. 2, and a depth of 282 ft. vertically from the surface. The Bella May claim is one of the properties of the Spokane Lead Mines Co., of which D. D. Birks is president.——W. W. Warner, general manager of the Sterling Silver-Lead Co. of Spokane, announces that the company has made application for the survey and patenting of several more of its claims, covering 300 acres. The company now owns 600 acres of mining claims in the district, and nearly half the shore-line on the Pend d'Oreille river. He reports the camp is lively with extensive development in progress on many of the properties.—— L. Bryant of Spokane has organized the Superior Copper Mining Co., which will develop the old Bay State mine, near Brown's lake, west of Chewelah

Special Correspondence.

London.

The Future of Esperanza.—Other Mexican Mines.—Camp Bird.—Tin Mining in Tasmania.—Resignations from the Institution.

A conviction appears to have taken root in the minds of dealers in the American mining market that the rich ore has failed, or will soon fail, with increasing depth in the Esperanza mine. This view does not find expression in the public utterances of the Company's officials. At the fourth general meeting of the shareholders held this week, referring to the developments, the Chairman pointed out that the north ends of the 6th and 6th intermediate levels continued to open up rich ore in the heart of the mine. How far and how deep this rich ore went in that locality future developments could alone determine; but the Chairman thought the bona-fide shareholder who refused to give the mine some credit for such a prospect as this bonanza shoot still offered must indeed be a pusillanimous person. He went on to say that the future of the mine probably depended chiefly, though not entirely, on the developments at depth. With regard to such prospects, he had already referred to the very satisfactory position of the deepest levels on the north end of the sixth level. In addition to this, as pointed out in the report, the evidence of their neighbors, as far as it went, was extremely promising. On the 1,000-ft. level of the El Oro mine a considerable length of ore had been found of substantial width and high value, establishing beyond any question of doubt that good ore was to be found in depth in this district. The 6th level, which was practically their deepest working in ore, was 400 ft. above this last strike of rich ore in the El Oro. The Mexico mine, on the other side, was also opening up rich ore, while their own developments in that neighborhood continued to be of a most satisfactory character. Looking to the whole situation, he had no hesitation in saying that in his opinion, the prospects of the Esperanza, which had shown itself to be one of the great gold mines of the world, continued to be bright and promising, and while they could not say what the gods might have in store for them, no impartial critic could deny that the possibilities of the mine at depth might yet exceed the most sanguine expectations. As voicing the desire of the London market for more light, a prominent stockbroker suggested that a small committee of prominent shareholders should be appointed, with an independent engineer, to report to the shareholders the exact position of the mine at the present time. This proposal was not adopted. Esperanza profit for the month of April is reported as $93,988.

The report for April from the El Oro states that the No. 1 100-stamp mill ran 28 days, the No. 2 100-stamp mill ran 29 days, and together crushed 21,524 tons of ore. The total estimated realizable value of the products is $190,631. Less working expenses, $101,899; less development expenses, $11,690; making $113,589 ($5.28 per ton), or a profit of $77,042. Profit from the railway for the month, $9,522. Total profit, $86,564. The sum of $15,801 was expended during the month on permanent improvements. During May the Mexico mine shipped 585 tons of ore, of an estimated value of $97 gold and 60 to 65 oz. silver per ton. Net proceeds, $62,500. Dolores profit for April is returned as $21,000 from a total production valued at $49,000.

Camp Bird has declared a final dividend of sixpence per share, free from income tax, payable June 26, making a total distribution of 12½% for the year ended April 30, 1907. During April the mill ran 28 days and crushed 6,125 tons of ore (dry weight), yielding 8,648 oz. bullion and 591 tons of concentrate. Amounts received from sales of product effected during the month: Bullion (including cyanide bullion), $152,123; concentrate (531 tons), $34,910; total, $187,033; expenses (including development, transportation, and treatment of product), $48,062; profit at mine, $138,971. Feet of development work, 570. The report winds up with the oft-repeated tantalizing remark that it must be borne in mind that the sales do not necessarily relate to the month's production, although some portion is included. Having regard to the sharp fall in price, it might be thought that as in the case of Esperanza, quoted above, doubts were prevalent as to the future of Camp Bird. It is more likely, however, to have been occasioned by the semi-panic conditions of the market as a whole. In such times holders are compelled to sell anything that will bring in money at short notice. On the other hand, Camp Bird would undoubtedly be more in favor with dealers if a monthly or even a quarterly statement of profit could be made, instead of a report of sales and expenses. At the same time it must be admitted that 12½% corresponds merely to a fair return on par in the case of a mining share of this description, as any prudent investor would consider that he should regard a large proportion of such a dividend in the light of a return of capital as a provision against exhaustion of mineral area. Of course such a basis for calculation is not applicable in the case of many mines (it might be said the majority of mines) that are less favorably situated than Camp Bird with regard to reserves of ore and future possibilities.

Briseis Tin Mines Ltd. (operating in Tasmania) has issued a satisfactory report for 1906 and shows good prospects for the immediate future. The proceeds of tin sold, with the tin in transit and on hand at December 31, since realized, amount to a total of £168,122, while expenditure at the mine was £30,162 and administration expenses in the colony, £1,733. The sum realized for the tin exceeds last year's figures by £72,000, though the mine expenses (including administration) are only increased by £2,500. The net profit for the year amounts to £128,557. The dividend and bonus for the year are equal to 37½% on the Company's capital, after payment of which a balance of £42,235 is carried forward. The total quantity of black tin produced was 1,408 tons of an average fineness of 75.3% metal. During the year under review 519,000 cu. yd. overburden were removed, as against 551,000 in the previous year, and the drift sluiced amounted to 616,000 cu. yd., as against 481,000, while the average yield from the latter works out with remarkable similarity, namely 5.68 lb. per cu. yd., as against 5.91 last year. The following details of the costs are of general interest and they indicate the nature of the operations:

	Tin ore won. £ per ton.	Metallic tin. £ per ton.
1. Sluicing	1.408	1.920
2. Hydraulicking, cleaning reef, breaking and stacking granite boulders, cement, and fallen basalt	3.448	4.703
3. Extending pipes and races in face, erecting elevators, maintenance	0.528	0.720
4. Cleaning-up, dressing, weighing, and bagging	0.661	0.902
5. Blacksmithing, blasting, and miscellaneous	0.452	0.616
6. Electric light	0.361	0.493
7. Head and tail races, maintenance, and repairs	0.863	1.177
8. General stores, timber, and explosives	0.535	0.730
9. Moving and repairs to main columns, salaries, office, and other general expenses	1.973	2.690
Total	10.229	13.951

The curiosity of the public has been aroused by the

announcement just made that C. Algernon Moreing and Herbert C. Hoover, partners in the firm of Bewick, Moreing & Co., have resigned from membership of the Institution of Mining & Metallurgy, and that W. J. Loring, J. A. Agnew, J. T. Hollow, and C. S. Herzig, members of the staff of Bewick, Moreing & Co., have also resigned. According to *The Daily Mail*, the many who are interested in the firm and the institution will scarcely be satisfied with that bald announcement, which will doubtless be followed by more information.

Morenci, Arizona.

Prosperity at Clifton and Morenci.—Raise in Wages.—New England Copper Co.—New Plant of Detroit Co.—Disposal of Tailing.—Ore Discovered in Limestone Quarry.

The two attempts of the Western Federation of Miners to organize unions in this place and Clifton have proved decided failures, practically no interest being displayed in the meetings by the employees of the operating companies in the Clifton-Morenci and Greenlee mining districts. These districts are now enjoying the greatest prosperity known in their history. A general raise in the scale of wages has been made. This is supposed to be because of the increased production and the prevailing high price of copper. The smelter of the Shannon Copper Co. at Clifton is handling ore from four or five of the minor companies in the district, among which are the Gold Belt D. & R. Co., and the Molder Mining Co. The Detroit Copper Mining Co. is treating ore from the Standard Copper Co.'s mines above Metcalf. The old company, known as the Home Copper Co. has been reorganized as the New York-Arizona Copper Co., with H. J. Degenar, president, and J. F. Cleaveland, vice-president, and a small number of shares have been placed on the market to raise funds for the further development of the property.

The New England Copper Co., whose mines are situated about four miles above Clifton, on the San Francisco river, is building a narrow-gauge railroad to connect with its property and the A. & N. M. Ry., by which their ore can be taken to the Shannon smelter. The Minneapolis Steel & Machinery Co. has just completed a large steel structure for the Detroit Copper Mining Co., which will be occupied by the converting plant. The structure is built just below the furnaces, and the converter-shells, of which there are three always in operation, can be charged from the furnaces through launders. A 40-ton electric crane, with a 10-ton auxiliary crane, manufactured by the Morgan Engineering Co., of Alliance, Ohio, has been installed to handle the matte and heavy machinery. The dimensions of the converter building are 60 by 180 ft., with an annex 40 by 150 ft. The floor-level of the annex is 10 ft. lower than that of the converter-building floor, and after the copper is poured into the molds and cooled, it is dumped through openings in the floor to a lower floor, where it is chipped, weighed, and run onto the Morenci Southern cars. The Minneapolis Steel & Machinery Co. has just completed the steel framework of the new machine-shop, dimensions 80 by 160 ft., for the Detroit Copper Mining Co. This company is also putting up some buildings for the Shannon Copper Co., at Clifton. The concrete tank for the mill-tailing of the Arizona Copper Co. at the bottom of their new No. 6 concentrator, is proving a success. The large tank is divided into four compartments. When one or two compartments are full of the drying tailing, other compartments are being filled with wet tailing, while still others are being emptied. In the centre of the tank is a large revolving crane with a double-jawed bucket which lifts the dry tailing and deposits it in bins, from which it is hoisted by cars operating on an incline, to trains above, and hauled to the Humboldt, Clay, and Longfellow mines to be used as stope-filling. This same company is building a large rock and concrete impounding tank and dam in Concentrator canyon, below its No. 5 concentrator. These efforts toward the solution of the tailing question are the direct result of the litigation recently instituted by the farmers of the Gila valley, into which the tailing flows. Recently, while getting rock from its limestone-quarry, the Detroit Co. cut into a wide vein of ore which assays over 10% copper. Development was commenced at once and the vein is improving with depth. This find is only a few hundred yards from the company smelter, on the same level, and in the middle of the limestone-quarry from which this company has been getting rock for the past five or six years.

Salt Lake, Utah.

Shipments From Park City.—Silver King Consolidation.—Ontario Drainage.—Freight Rates.—Output of Tintic.

The ore shipments from Park City last week amounted to a little more than 1,100 tons, the contributing mines and amounts being: Daly, 50; Silver King, 737; Daly

Map of Arizona.

West, 491; Ontario, 38; Daly Judge, 480; Little Bell, 72; other mines, 78 tons.——The articles of incorporation of the Silver King Coalition Mines Co. have been filed with the proper State and County officials. The capital stock is 1,250,000 shares of $5 each and former Senator Kearns is given as general manager. This corporation takes over the business of the Silver King, Keith Kearns, Pinyon Ridge, and other Park City mining companies. While F. Augustus Heinze does not appear as a director, it is understood that he will soon be given a place upon the board. The State of Utah received a fee of $1,570 for the filing of the articles.——The drainage of the Ontario mine at Park City by means of pumps has been undertaken. Three sinking pumps, with a combined capacity of 1,500 gal. per min. have been installed at shaft No. 3. The water is to be lifted to tunnel No. 1, and thence run off through a drift to shaft No. 2, where it will be dropped to the drainage adit.——G. W. Lambourne, manager for the Daly Judge Mining Co. at Park City,

states that preliminary steps are being taken toward the erection of a plant for the treatment of zinc ore. The Daly Judge mine contains a large tonnage of such ore.

The Tintic Mine Owners' Association has obtained reduced freight rates on ore shipped to the Salt Lake valley smelters. The question was taken up with the transportation companies over a year ago. Hereafter the net value of the ore will be the basis on which charges will be made. On July 1, on ore netting $5 per ton the freight rate will be $1.10; ore of the net value of over $5 and under $10, $1.25 per ton; ore of the net value of over $10 and under $15, $1.75 per ton; ore of the net value of over $15 and under $20, $2.25; ore netting over $50 per ton, $3 per ton.——The State Board of Equalization has made a ruling requiring lessees in mines to pay a bullion tax in accordance with a law passed at the last session of the legislature. Lessees operating in the Tintic district have signified their intention of employing attorneys with a view to testing the constitutionality of the law.

The ore shipments from the Tintic district last week amounted to 151 carloads, the contributing mines and amounts being: Ajax, 4; Beck Tunnel, 9; Bullion Beck, 3; Carisa, 7; Colorado, 6; Centennial Eureka, 44; De Pue, 4; Eureka Hill, 9; Graud Central, 3; Gemini, 5; Lower Mammoth, 9; La Clede, 2; May Day, 5; Mammoth, 20; Scranton, 6; Tiutic Iron, 5; Uncle Sam, 4; Victoria, 1; Yankee Con., 5 carloads.——Two sections of the Utah Copper Co.'s Garfield milling plant are in commission and the third will be put into service about July 1.

Toronto, Canada.

Bush Fires in Ontario.—Larder Lake.—Shipments From Cobalt.—News of Development.—The Nipissing.

During the last few days northern Ontario has suffered greatly from the ravages of bush fires which have done damage to the mining districts, especially in the townships of James, Smyth, and Tudhope in the Montreal River district, and the neighboring portion of the Temagami Forest Reserve. Many prospectors have lost everything and narrowly escaped with their lives. The two camps of the Munroe-Saville company, and the Brien-Mahon, Harbeck, and May camps were destroyed, with large quantities of supplies, and the fires have destroyed so many stakes that it will be difficult to identify claims. The destruction of so much timber will make prospecting easier. Reports were current of loss of life, but the Department of Mines states that there is no reason to believe that any actual fatalities have occurred. The loss of timber is roughly estimated at $1,000,000. The camp buildings of the Green-Meehan mine narrowly escaped destruction, and were only saved by great exertions.

W. A. Campbell, Deputy Commissioner of Public Works, has returned to Toronto from Larder lake, where he has been engaged in laying out a wagon-road from Boston station on the Temagami & Northern Ontario Railway, to Larder City, a distance of 20 miles. The only roads so far are mere forest trails, and packing freight into the camp costs $100 per ton. It is hoped to have the road finished before the close of summer. Mr. Campbell states that there are about 4,000 people in the district.

Ore shipments from Cobalt for the week ending June 15 amounted to 204 tons from the following mines: Coniagas, 139 tons; Nipissing, 28; Right of Way, 36 tons of ore.

A meeting of the shareholders of the Foster-Cobalt Co. has been called for the 27th to consider the future course of development, and to sanction a by-law for the sale of treasury stock. The president, J. G. Kent, has issued a report to the effect that development and preparatory work has consumed all the funds. Less than one-fourth of the property has been partially explored, and the extreme depth reached is 75 ft., and deeper sinking and cross-cutting to cut veins not driven upon, are recommended by the engineers at an expense of about $10,000 monthly. To raise the money it is proposed to sell $100,000 of treasury stock.

Butte, Montana.

Reports of Mining Companies.—Interesting Figures.—Ida-Montana Assays.—Butte & Milwaukee.—The Green-Campbell Fiasco.

The completed reports of Butte mining companies for the year ending May 31, 1907, show the total net earnings of all mines to have been $20,263,291, against $17,489,695 for the year previous, an increase of $2,773,596. The complete statements show the following net earnings for 1907:

Boston & Montana	$7,049,988	North Butte	$3,271,214
Anaconda	5,819,184	Butte Coalition	1,432,760
Butte & Boston	1,249,467	Clark's Original	663,259
Parrot	147,731	La France	151,012
Trenton	481,624	Monida Trust	3,052

These figures are furnished to the Assessor of Silver Bow county, for purposes of taxation, and there has always been much questioning and doubt in the public mind as to the accuracy and value of them, the general opinion of corporations being such that the companies are not given credit for exactness in these matters. It is a notorious fact that some of the mining companies never make their reports until others have done so, and then report net earnings at about the same ratio to those of the other companies as in former years. It is also a fact that other companies, although the facts and figures were at hand in Butte, could not make their reports until they received instructions from the East, all of which has added to the public doubt as to the accuracy of the net earnings statements. One company for years annually reported its net earnings at exactly $600,000. The interesting portion of these annual reports is that relating to comparative yields per ton of ore, costs of mining, and reduction per ton. Some of these comparisons follow:

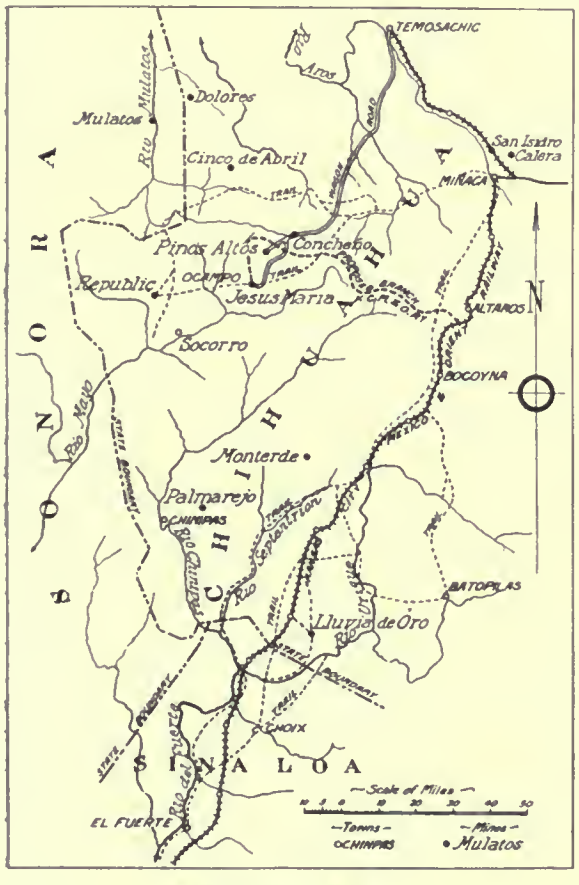
Company.	Gross yield.	Cost of mining.	Cost of reduction.
Boston & Montana	$14.37	$3.93	$2.67
Anaconda	12.23	4.47	2.52
Butte & Boston	10.89	3.79	2.28
Parrot	10.54	5.64	2.18
Trenton	9.96	3.64	2.21
Washoe	10.92	4.05	2.31
North Butte	17.47	4.53	4.00
Butte Coalition	11.55	5.49	2.29
Clark's Original	9.31	4.08	2.49
La France	14.18	6.35	3.19

W. D. Greenough, the manager of the Snowstorm Mining Co., says increased dividends will soon be paid. A number of important improvements are under way at the Snowstorm mine. The Northern Pacific railway is constructing additional side-tracks near the mine in order to be able to supply more cars for the transportation of ore. The mill is being enlarged, and three new leaching vats of much larger capacity than those now in use will be added to increase the capacity of the concentrator. The ore between 2 and 3% is being treated at the mill, while the higher grade stuff now being taken from the east drift on No. 3 level, running above 8% copper, is shipped direct to the smelters. A 300-h.p. compressor is being installed, and will be operated by water-power. A new 20-drill compressor has also been ordered. The cost of the improvements under way will be about $50,000.——It is reported that the Ida-Montana

Co. has struck six feet of chalcopyrite ore about 65 ft. southeast of the 250-ft. station. The ore-shoot is near the middle of a vein that has a width of 52 ft. The strike is considered important, as it is the first important orebody found so far east in that part of the district. The shaft of the company is down 330 ft., and another cross-cut will be made at the 400-ft. level.

The Coalition, North Butte, and Parrot have been doing an unusual amount of 'dead' work, such as exploration and development, all of which was taxed as cost of mining. The ore from the Anaconda, Butte & Boston, Parrot, Trenton, Washoe, North Butte, and a portion of that from the Coalition mines, is treated at the Washoe smelter of the Amalgamated Co. at Anaconda. The grade and character of the ore govern the cost of reduction. The North Butte sends more first-class ore to the smelter than any other company.

The Ida-Montana assay-returns from the vein cut on the 250-ft. level show 4.5% copper, 8 oz. silver, and $1.80 in gold per ton, while a small streak of the ore assays



Map of Part of Mexico.

17.6% copper. The shaft is nearly 400 ft. deep and another cross-cut will be run to the vein from the 400-ft. station.——The Butte & Milwaukee Copper Co. is making good progress in sinking the shaft of the Colonel Sellers mine. It is now down 400 ft. Orders have been placed for a new first-motion hoist and other machinery. The new engine will have a capacity to sink to 2,000 ft. The shaft on the Colonel Sellers was started last January. The cost of installing the surface plant was considerably increased owing to the cold weather at the time, but good progress has been made. The shaft is 4½ by 16 ft. in the clear, timbered with 12 by 12-in. timbers. The cost of sinking is now $63 per foot, which is said to be as low as the cost of any shaft of that size in Butte. It is going down at the rate of 90 ft. per month. The intention is to cross-cut the vein, which lies a short distance south of the shaft, at 700 feet.

At a meeting of the stockholders of the Green-Campbell Consolidated Gold Mining Co., held in Butte last week, it was voted to give a lease and bond on the property of the company to a new concern, known as the United Mining Co., for $210,000. If the option is taken up the money will just about pay the bonds and unsecured debts of the Green-Campbell Co., and the stockholders will have their beautifully printed certificates to show for their investments. The property of the Green-Campbell Co. is situated in the Silver Star district of Madison county. It is a big low-grade gold proposition, but there is no water within miles and an amateurish effort was made to run the mill with the water pumped from the mine, which proved a fizzle.

Mexico City.

The Oaxaca Smelting Co. and the Magdalena Smelter.—Stimulus to Local Mining.—A Fine Plant.—The Taviche District.—Sale of Rio Tinto Smelter.—Increase of Capacity.—To Treat Custom Ores.

At last the plant of the Oaxaca Smelting & Refining Co., near Oaxaca, State of Oaxaca, is completed, and a trial run has been made, but as yet not sufficient ore has been obtained to run at full blast. The building of this plant was started early last year, with T. J. Ryder, E. N. Brown, and J. B. Body as the prime leaders, and everything went along smoothly and rapidly until late in the fall, but when it was supposed the plant would be about ready to blow in, all work suddenly ceased, and so things remained up to within about two months ago. People in a position to know say that the leading spirits found that they had such a good thing they were not willing to take in with them some moneyed interests that were anxious to join them, and then when it was found that more money was needed than had been counted on, and the money interests were turned to they were not found so easy, having been left out when all was rosy, so work had to cease. However true this reason may be, it is true that the option held by the Oaxaca Smelting & Refining Co. on the smelter (known as the Magdalena, of 50 tons capacity), and mines of the Guadalupe & San Rafael Mining Co., which were the key to the lead situation of the district, at a price of 550,000 *pesos*, on which 20,000 *pesos* forfeit was paid, went by default, and Messrs. Williams and Hamer retained control of the Guadalupe and San Rafael, and have been adding to their holdings, while the Magdalena smelter has been running continuously for the past 12 months. It is believed, though, that some understanding has been reached between the Oaxaca S. & R. Co. and the Magdalena people (Messrs. Williams & Hamer), for otherwise it is doubtful if the Oaxaca plant would have been completed and blown in, as the Williams & Hamer properties are the only ones in the Oaxaca district producing any quantity of lead. If such an understanding has been reached, the deal cannot have been fully consummated as yet, for the Magdalena smelter is still in blast and, as stated above, the Oaxaca plant has not sufficient with which to run at full capacity. Certain it is, though, its difficulties with regard to sufficient capital have been straightened out, and the matter of ore will be greatly relieved on the completion of the San Juan de Oaxaca railroad (of Chas. A. Hamilton), which is to run from Oaxaca to Ejutla, and which is expected to reach Taviche by the end of July. Furthermore, up to the present time the freight and treatment charges in Oaxaca have been held at 12 *pesos* per ton, so that a great deal of fair ore has had to either remain in the mines or go over the dump, but which now should be handled at a profit. This new plant of the Oaxaca S. & R. Co. is thoroughly up-to-date in every particular, and wherever possible electricity has been employed, individual motors being used for mills, crushers, pumps, and

the like. The blowers are run by a Nordberg engine, as is also the main electric power-plant, which consists of a Westinghouse 100-kw. alternating-current generator of 440 volts and 60 cycles, with switchboard, exciter, etc., furnished by G. & O. Braniff, of Mexico City.

The Gardemo Co. is working the Gardemo mine, and soon there will be enough ore blocked out to keep the 16 stamps running.——For six months past C. S. Westbrook has been prospecting for copper with encouraging results; he also owns a number of gold prospects that are showing up well. Mr. Westbrook is associated with a number of wealthy miners in the United States, and has made arrangements to run a cross-cut over 700 metres to develop his silver property at San Vicente, near Coyuca de Catalan.

A right of exploration in the Zapote district has been granted to H. E. Shepherd, and he has recently made a number of rich gold strikes in this new locality. One of them is close to the San Jose river; the vein is in porphyry, about 28 in. wide, and averages 32 gm. gold per ton. He is at present treating the ore by *arrastres*, but expects to have a five-stamp mill running by the end of the rainy season.

The Taviche district of Oaxaca is experiencing a veritable boom. The San Francisco mine is making an excellent showing, taking up considerable ore running as high as 2,000 *pesos* per ton. The Treadwell Co. has made a rich strike of copper ore on the 300-ft. level, and the Consuela and Veronica look most promising.

In my letter of last week I referred to the small smelter of the Rio Tinto Mining Co. at Terrazas, 25 miles distant on the Mexican Central railroad, north of Chihuahua, and stated that in all probability this smelter would be closed down on the completion of the American Smelting & Refining Co.'s new plant at Chihuahua. Since the date of my letter it has been made public that the Rio Tinto mines and smelter have been sold for 1,500,000 *pesos* to a corporation to be known as the Rio Tinto Mines & Smelting Co., with a capital of 3,000,000 *pesos*, controlled by Martin J. Condon, president of the American Snuff Co., and associates. It is said to be the intention of the company to increase the present smelter at Terrazas to 600 tons capacity, and that orders have been placed for these additions. There are 25,000 tons of low-grade ore in the old dump that will be available with larger capacity. The existing smelter will be kept in operation until the completion of the new plant, which will require about eight months. Juan A. Creel, brother of Mexico's Ambassador to the United States, and manager of the Banco Minero, of Chihuahua, the richest bank in northern Mexico, who was one of the principal owners of the Rio Tinto mines, will retain a good interest in the new company.

The other owners are identified with the Veta Colorado Mining & Smelting Co., which owns the Veta Colorado, San Cristobal, Quebradillas, and Gran Bretaña in the Parral district, and which is also building a 500-ton mill at Minas Nuevas, near Parral. The new company has also obtained large holdings at Savonarola, about 35 miles west from Ortiz, on the Mexican Central, to which point a narrow-gauge road may be driven. While primarily for the treatment of its own ores, the new plant will also compete for custom ores as an entirely independent concern from the American Smelting & Refining Co. John N. A. Conner, manager of the Veta Colorado Mining and Smelting Co., will also be manager of the Rio Tinto Mines & Smelting Co. The only reason for discounting the statements of this company is the issue of a fine prospectus for the purpose of selling stock.

Leadville, Colorado.

The Mammoth Discovery.—An Important Event.—Good News From Sugar Loaf.—The Reindeer Mine.—Prospecting Schemes.—Car Shortage.—Treatment of Complex Ores.

The recent strike in the Mammoth shaft has excited the liveliest interest. In one of the first drifts opened, a large body of lead ore was exposed that averaged more than 30% lead and was rich in silver. Just before the previous operators were driven from the workings by a flood of water, considerable mineral was noticed in the floor of the drifts, but its importance was not realized. Since cleaning out the drifts, the present operators have come into possession of a lead shoot seven feet high, and have the shoot opened up for more than 20 ft., but it is too early to estimate the extent of this mineral body. As far as the local geologists can determine, it is an entirely new orebody; although one geologist, whose opinion carries weight, is of the opinion that it ties to one of the big shoots of Iron hill. At present but little exploration work is being done by the Mammoth owing to the fact that the 10-in. water-column, which is being installed, is not yet complete. Whatever the relationship of the ore-shoot to other deposits, the discovery adds an incalculable prospective value to a large area of virgin territory in that vicinity of Big Evans gulch. The company has practically completed one of the best power and pumping plants of the district, and will probably ship a considerable tonnage during the coming month.

Another important addition to the list of shippers is the Bartlett Tunnel. The manager reports that a large quantity of ore from the new shoot runs above $1,000 per ton, and that several carloads of ore shipped to the local smelter gave returns above $20,000 per car. The discovery in the Bartlett will stimulate development work on Sugar Loaf Mtn. and has given impetus to the work of the Dinero Co., since the latter will cut the Bartlett vein before reaching the Dinero vein some distance beyond. As formerly stated by your correspondent, the original Bartlett shaft was sunk on the vein to a depth of a little less than 300 ft., but was abandoned on account of a flood of water. An adit scheme was then conceived and a bore driven 1,300 ft., cutting the vein seven feet below the shaft. Several cars of ore were shipped, when the lease expired and the present company (styled the Halcyon) secured the ground. The lessees have sunk the shaft to a much greater depth and found a stronger shoot of ore than that worked by previous operators. For the past two weeks the Halcyon company has shipped more than 20 tons daily, much of which is rich.

It is reported that an important orebody has been opened upon the Reindeer on Rock hill. This part of the camp has developed into one of the best in the district, and the most substantial additions have been made during the past twelve months. Much local interest is being centred upon the development work in progress at the Hoffer shaft in lower Big Evans gulch. This shaft reached the blue lime at 300-ft. depth and a drift driven from the bottom of the shaft toward the south has exposed considerable mineral in the form of patches of lead and iron sulphides. These deposits, while not important in themselves, lead the promoters of the enterprise to believe an orebody will soon be developed. It is proposed to sink the shaft 200 ft. deeper, where the white lime should be found according to the information furnished by the Coronado workings. With the sinking of the Penrose shaft, the Hoffer shaft was drained, thus materially cheapening the process of shaft sinking.

The success that has attended the Boston-Arizona mill at the foot of Harrison avenue, has induced the company to increase the capacity to 200 tons daily. This mill was

erected to treat the Emmett dump for its zinc contents. The demand for zinc has rendered it necessary for many properties throughout the district to add milling plants. There are several million tons of zinc ore that will yield a fair profit tied up in the big dumps of Leadville, and these are gradually coming into the market. The famous A. Y. & Minnie and Col. Sellers dumps will soon cease to be landmarks, and the new mill owned by the Leadville District Mining Co. has begun to treat the Ibex dump (Little Johnny) at the rate of 100 tons daily.

There is a certain quantity of ore being developed that it is difficult to market without previous treatment, for instance, such ore as runs high in zinc and at the same time carries lead and silver. The lead smelters are not prepared to handle the zinc and the zinc smelters object to a settlement on the lead and silver basis. The United States Smelting Co. is receiving a considerable tonnage of this material and certain Eastern plants purchase moderate quantities. The Iron-Silver company has finally contracted with the U. S. Smelting Co. and a zinc smelter at Coffeeville, Kansas, for treatment on 1,000 tons monthly of this product.——Two new boilers have been installed at the Helena in Iowa gulch, and as soon as the water can be beaten down again the shaft will be sunk another lift. A good vein of sulphides was cut at the 500-ft. level, but this will be held in reserve until further development work has been carried on below.

Cripple Creek, Colorado.

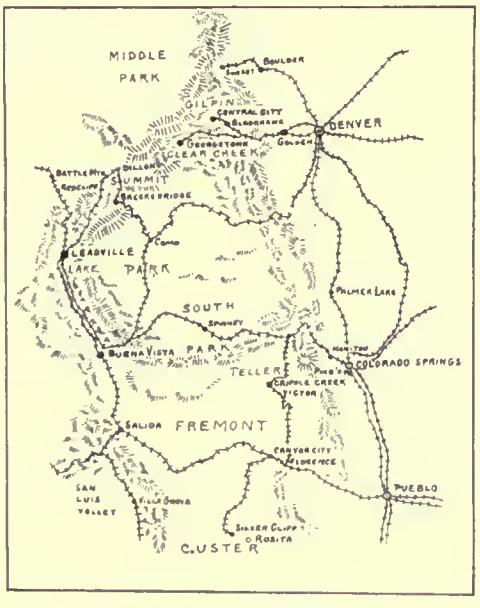
Unwatering the Gold Coin.—Scarcity of Drill-Men.—Union Leasing Co.—Contract for Drainage Adit.—Cave in the Portland.

Shipments of ore from the Mohican mine on Battle Mtn. have been stopped temporarily owing to litigation in which the Mohican company has brought action to restrain Anderson & Olsen, lessees, from operating the property. In view of an early settlement of the lawsuit, the lessees are now blocking out ore on the 700-ft. level near the shaft. The vein varies in width from 3 to 5 ft., the ore shipped averaging $25 per ton.——The unwatering of the Gold Coin shaft is progressing rapidly by means of the pump on the 1,000-ft. level and the two bailers, and the shaft should be drained to the 1,200-ft. level within two or three weeks. The water is raised to within 130 ft. of the collar of the shaft, where it is conveyed through the Columbine tunnel into Eclipse gulch, a distance of three-quarters of a mile.

The Cripple Creek district is at the present time suffering from a scarcity of men, especially machine-men. Many of the mines are running shorthanded, retarding operations to a certain extent.—— The Union Leasing Co., operating in the Husted shaft of the Mabel M. claim of the Gold Dollar Co., on Beacon hill, has decided to sink the shaft from the 200 to the 600-ft. level. A good orebody was encountered on the 300-ft. level of the Mabel M. shaft in a cross-cut to the south; it is hoped to cut it at greater depth.—— Good ore is being shipped by D. Whitney and J. McMullin from their lease on the 800-ft. level of No. 2 shaft of the Vindicator, on Bull hill. A new orebody has recently been opened up in a raise between the 700 and 800-ft. levels. The ore is being stoped by three machines for an average width of 3½ ft., the screening from which runs in the neighborhood of $30, and the bulk ore from $50 to $80 per ton. On the 500-ft. level ore is also being broken by one machine from a vein five feet wide.

The contract for driving the drainage adit has been awarded to Charles Lund and Charles Stream, and their $20,000 bond to insure the company against all liens has been approved. A rate of 350 ft. per month is to be maintained by the contractors, the adit to be 7 by 10 ft. in the clear. The Tunnel Company will furnish all timbers, pipe, and rails, as well as the necessary power. Seventy-five per cent of the amount due each month will be paid the contractors, the remainder to be withheld until the completion of the contract. It is proposed to sink an intermediate shaft from the surface at a distance of 9,000 ft. from the mouth. This shaft will be between 600 to 700 ft. deep and will materially decrease the time of driving the bore. A boarding-house to accommodate the employees has been started by Charles Lund, as the mouth of the adit is several miles from the town of Cripple Creek.

A contract has been let to Oscar Anderson to sink the new Dante shaft on Bull hill from the present depth of 120 ft. to the point where it will connect with the workings above the Trail tunnel, a distance of 150 ft. The British American Mining Co. has this property under



A Part of Colorado.

lease and is sinking the shaft so as to facilitate the handling of a large production. The production at the present time is limited, owing to the long tram through the Trail tunnel, a distance of 3,000 ft. The contractor is to receive $8 per foot and put in all timbers, but the latter, as well as all supplies, will be furnished by the company, which will also do the hoisting. It is estimated that there are about 5,000 tons of ore already broken in the stopes, but only occasional shipments are being made pending the completion of the shaft. The portion of the Trail tunnel on the claim of that name is under lease to B. G. Granville, who has recently opened up a good vein between 2 and 3 ft. wide. Shipments run about $25 per ton. Granville has rented the Van Fleet cyanide mill, at Goldfield, and he proposes to treat the ore from his lease. Experimental tests are now being made.—— The Western Investment Co. is also leasing on the Trail tunnel and has encountered the extension of the Dante vein. The vein is here about 10 ft. wide and two shipments recently made have given returns around $20 per ton.

A cave occurred at the Portland mine, on Battle Mtn. The surface ground under a part of the No. 2 dump gave way, causing about 10,000 tons of waste rock to fall into the open stopes down as far as the 100-ft. level. Here its descent was arrested by a thin shell of ground, which prevented the rock from going to the 900-ft. level, which it would otherwise have done. Owing to the sinking of the dump, the tram from the ore-house has been temporarily put out of commission.

Concentrates.

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

CORROSION of a boiler causes pitting and honeycombing of the tubes, shell, and other exposed parts, rapidly weakening the boiler, and thus rendering it dangerous.

PHOSPHORUS combines readily with molten copper, but small proportions of the element have no injurious effects. Larger amounts, however, over 0.5%, render it red-short.

BASIC PIG IRON in America is pig iron containing so little silicon (not more than 1%) and sulphur that it is suited for easy conversion into steel by the basic open-hearth process.

SALT is not confined to any particular geological horizon, but it is found in nearly all unmetamorphosed sedimentary rocks, including those which are forming at the present day.

FOR the treatment by cyanide of non-refractory ores, wet crushing takes precedence, owing to the large output usually obtained. And for the wet-crushing, the gravity-stamp is most used.

VARIOUS precipitants for gold, in cyanide solutions, other than zinc shavings, have been tried from time to time, such as aluminum, sodium amalgam, zinc dust or fume, and electricity.

THE fluorspar-bearing belt of the Kentucky-Illinois district forms a zone of Mississippian (Lower Carboniferous) limestone ubout 75 miles long, from northwest to southeast, and 30 miles wide.

WHEN a claim is owned with a partner and another claim is held under individual ownership, it is unsafe to do the work on the partnership claim with the idea of applying such work to all the claims.

THE best form of wire rope for splicing is that made with six strands, as the strands are then the exact size for the core of rope, and are readily substituted for the core as it is being pulled out to allow the strands to take its place.

PRIMING AND FOAMING in a boiler are both extremely annoying and make various kinds of trouble. The efficiency of the engine is greatly decreased through water getting into the cylinders, and cylinders are wrecked, and cross-heads and connecting rods broken.

THE most valuable members of the asphaltum series are ozocerite, wurzilite, grahamite, and gilsonite. With the exception of grahamite, these occur in commercially important quantities, as far as yet reported, only in the State of Utah. They are prized for the manufacture of certain varnishes and for the insulation of electric wires.

APATITE, a crystallized mineral consisting essentially of phosphate of lime, occurs in igneous rocks in many parts of the United States, particularly in St. Lawrence county, New York, but nowhere in sufficiently large quantities to pay for mining. Apatite has been mined to some extent in Canada in previous years, but its production has ceased.

THE usual form of machine for generating the current for electric blasting, is a small hand dynamo, in which the armature is caused to revolve between the poles of the magnet by means of a rack and pinion during the down stroke of a handle. As soon as the lower end of the rack comes in contact with the contact-breaker at the bottom, the current is directed to the outside circuit of fuses and the explosion takes place.

THERE is practically no production of metallic tin in the United States, the only production being an insignificant quantity of ore from the placers of Buck Creek, Alaska. There is no output from the lode claims of the York region, Alaska; none from South Carolina, although 18 tons were washed from the residual placers at Gaffney, in the northern part of that State, in one year; nor is there much production reported from the Black Hills region of South Dakota and Wyoming.

THE high price of diamonds has made the search for these precious stones in the United States and Canada keener than ever before. In the examination by the United States Geological Survey of many samples of gold and platinum sands during the Lewis & Clark Exposition at Portland, diamonds were carefully looked for. Diamonds have been watched for also by a number of parties that have been dredging for gold on an extensive scale in the rivers of California, but in neither case have any finds been reported.

ALL natural waters contain more or less foreign matter, either in solution or suspension. These impurities produce three general deleterious effects, which are priming or foaming, corrosion, and scale deposition. Those impurities which tend to cause priming are sodium carbonate, organic matter, and various alkalies; those causing corrosion are sulphuric, nitric, hydrochloric, tannic, and acetic acids, chloride, and sulphate of magnesia, organic matter, and sugars; while those tending to cause scale are carbonates, sulphates of lime and magnesia, soluble salts, silica, oxides of iron, alumina, mud and sand in suspension, and organic matter.

PURE gypsum is white and, when in the crystalline form, translucent. The impurities which it commonly contains usually destroy its translucency and affect its color, so that the mineral as mined is an opaque, fine-grained mass, varying from white to reddish, gray, or brown in color. Gypsum can be distinguished from most other minerals by its extreme softness, for even when in the crystalline form it can be readily scratched by the finger nail. When treated with acids it does not effervesce. On heating it loses its water of crystallization and, if previously translucent, becomes a chalky opaque white. Pure crystalline specimens have a specific gravity of 2.30 to 2.33.

IN THE Elmore oil process of concentration, the pulp from Huntington mills passes directly into the open end of a horizontal rotating drum, inside of which is a helix with paddles that lift up the pulp and drop it again, at the same time propelling it forward. With the pulp is admitted a small quantity of thick, sticky oil, which is subjected to the same agitation as the pulp. This oil exercises the remarkable property of sticking to and buoying up the particles of metallic minerals that are suspended in the pulp, but it does not stick to or effect the particles of rock gangue. The oil and pulp discharge into a spitzkasten, in which the tailing settles to the bottom, while the oil floats to the top and carries off the valuable mineral. This mixture is then run into a centrifugal machine, where the oil and mineral are separated.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy.

The Requirements of Modern Mining.

The Editor:

Sir—I read with exceptional interest the article by J. R. Finlay on 'The Requirements of Modern Mining,' which appeared in the issue of April 20. It seemed to me both instructive and suggestive, and I have looked to see an edifying discussion initiated by it.

The texts for such discussion appeared to me to be found in the following sentences: "In its broad aspects mining is far more a question of human relations and facts, than of natural relations and facts," and "It is a comfort to know that the business of mining is no fake, but a most essential—and perhaps the most distinctive—part of modern civilization." The thought that these statements carried for me was that they are true and have been made true by the faithful diligent study of the mining engineer.

Mr. Finlay analyzes the business of mining into five divisions. The first of these, covering ore and mineral deposits, he places entirely in "the realm of natural phenomena and facts." Now, while this is true in a sense as a feature of Mr. Finlay's argument, 'ore,' as a matter of fact, is rock that will yield a margin of profit above cost of extraction and treatment. The mining engineer has been the most important factor in changing the significance of natural phenomena and making 'ore' out of what was formerly worthless 'rock.' The world may never again see a Comstock bonanza, but vast areas of porphyry, lately only country rock, are going to yield in the aggregate more millions than ever came from all the world's bonanzas of high-grade ore. While industrial development in other lines has been prodigious and has aided much in bringing about the above condition, it is none the less true that without the evolution of the exact science of mining and ore-treatment by the mining engineer this porphyry would not be ore and the "natural phenomena" involved would have a very different significance.

Of course, as civilization advances and wealth increases, it requires more and more skillful figuring to insure profit. This is true in every line of endeavor. To make money out of a railroad, bank, department store, or factory requires a high order of financial and administrative ability. The point that Mr. Finlay has made so clear is that the mining engineer has lifted his profession into equal dignity and importance with any other class of business enterprises and perhaps made the results more certain than in any other line.

The question that he raises seems to me to be: What change, if any, must be made in the curriculum of the schools to best fit the mining engineer for the changed conditions that have come, partly through the achievements of the profession, and partly from changed conditions generally in the world, and for the engineer who has left the schools and is in practice, what shall be the character of study best calculated to increase his efficiency and chance of great success?

The mining industry has justly won the confidence of men. The demand for its product outruns the supply. Civilization is in need of an increasing output of metals. The profession that has achieved this result is entitled to the amplest reward. How shall it be secured.

JAMES W. ABBOTT.

Pioche, Nevada, June 8.

Blast-Furnace vs. Reverberatory.

The Editor:

Sir—In looking over the contribution of Mr. Harry Charles in your issue of January 26, I see several points that I desire to discuss, as the intent of the questions seems to have been misunderstood.

1. *On what should the choice of furnace type be principally based? Choice of ore, fuel, fluxes, building materials?*

It seems to me that the choice of furnace must in large part be governed by the type of slag that will be of greatest economical value to the operator. It is safe to say that in the reverberatory the flux for the silica of the ore is furnished by the iron, and in the blast-furnace it is (to the extent of nearly, or quite, one-half) furnished by lime. The contents of the ore in question as regards these fluxing qualities should therefore enter into the question to at least as great an extent as the question of physical character. Silica is the great enemy of the smelter-man. To make the cleanest slag carrying the most silica, and at the same time get speed of smelting, is the governing question in practically every works.

In the blast-furnace one can smelt any character of ore, producing any type of slag, as far as the chemical reactions are concerned, but the physical conditions must be perfected to get the best results, that is, the fine must be agglomerated, or too much loss by flue-dust will result. The reverberatory furnace should only handle *hot* material fresh from the roasting furnaces, and this practically precludes the use of much lime flux, as the limestone would add materially to the cost of the roasting operation and of the roasting plant. This, therefore, brings us again to the chemical analysis of the ore in question, and we find that the reverberatory is best suited to such ores or materials as require roasting, and are either naturally or artificially fine, and carry sufficient iron for their own fluxing.

Even if we accept this description of the characteristics of the reverberatory ores, we must ask the question, is it commercial to use the iron of this ore to flux all the silica of the charge, or would it not be more profitable to use some lime instead, particularly as this addition tends to reduce the metal-losses? If our irony material carries little metal-value aside from the flux-value, and the silicious ores to be added to the charge must be looked to for the profits of the operation, we shall naturally turn to that type of slag and furnace in which we get the greatest flux-value of the ore. This is undoubtedly obtained in the blast-furnace, and there can be no doubt that in many such cases it would pay either to briquette or sinter the fine iron-sulphide and smelt in the blast-furnace, rather than to roast them and smelt in the reverberatory. In the Montana case cited by Mr. Charles the charges of the blast and reverberatory furnaces were radically different, hence the comparison of slag-volumes produced and the deductions based on it are wrong. If the iron material sent to the reverberatory had been smelted in the blast-furnace to make the same type of slag as the reverberatory made, there is no doubt as to the comparative slag-losses; the blast-furnace would be way ahead. As it is, his figures are misleading, the materials smelted in the plant in question averaged close to 7%, not 2% Cu, and the reverberatory slags averaged not 0.25%, but closer to 0.6% Cu, and if the calculation is made on this basis, it comes out in favor of the blast-furnace. I agree with Mr. Charles that a plant containing both types of furnaces is the best, but instead of using the reverberatory as the smelting furnace and the blast-furnace as a sort of sewer into which all the odds and ends and clean-ups are thrown, I

would do my work in the blast-furnace and roast and smelt only such material in the reverberatory as is not profitable in the blast. This would include probably much of the flue-dust and such fine concentrate as is too silicious to afford much free iron.

2. *What are the comparative costs per ton of daily capacity of each type of furnace?*

Mr. Charles mistakes this question, which refers to the cost of the plant, not of the *operation*. The figures that he uses, however, are so far from the actual cost of the operation at Butte that they must have been used by him merely suggestively.

5. *What are the comparative costs of power, labor, fuel, and repairs?*

COMPARATIVE COSTS.

	Blast-furnace.	Reverberatory.
	%	%
Power	9.4	2.2
Labor	25.5	32.4
Fuel	42.7	57.7
Repairs	5.1	8.9

These percentages are of the total cost of each furnace-operation.

There is no doubt of the efficiency and economy of boilers placed in the flues of reverberatory furnaces, nor of the advantages gained thereby, over such furnaces without boilers, but this matter has been carried so far as to advocate the reverberatory system simply on account of this gain in boiler-power. I think it probable that the use of part of this waste heat to pre-heat the air for combustion in the furnace itself would result in almost as great a saving as in boilers.

6. *What are the comparative amounts of capital tied up in furnaces of each type, and how does this affect the cost per ton of daily capacity, or of output?*

Two hundred tons of 40% matte carrying 30 oz. silver per ton, at present metal prices, and at 10% interest, amounts to about eight cents per ton on 150 tons per day for 350 days. The bottom of a reverberatory furnace absorbs an unknown amount of metal, sufficient to bring this charge up to at least 10c. per ton. In the case where the mattes are higher in gold and silver than at Butte, this item becomes of much moment, particularly on gold ores.

7. *What are the limiting necessities in the way of fuel for each type?*

I am inclined to think that the limits of useful coals for the reverberatory work is a much narrower one than for coke for the blast-furnace. It is easier to do good work on poor coke than on poor coal, and the tonnage of the reverberatory is much more dependent on the fuel than is the blast-furnace. Naturally, as the ash in the coke runs up to 22% one must use more of it, but if the coal for the reverberatory happens to have an easily fusible ash, trouble is constant, and large capacity impossible. Thus, two mines in the same district of Rock Springs do not produce the same coal; one is good, the other bad on account of the fusibility of the ash, and an addition of 33% of the poor kind will cut the furnace tonnage 50 per cent.

If the coal becomes too poor, it is necessary to go into the gas-fired reverberatory furnace, with its producers, regenerative checker work, and other expensive adjuncts. Wood is not to be considered any more. Oil is demonstrated as an excellent fuel for the reverberatory, but it is not everywhere obtainable, neither is Rock Springs slack, and I do not know of any large or successful reverberatory plant that is out of reach of one or the other of these fuels, unless it uses producer-gas.

8. *What are the comparative losses in slag, dust, or middle products?*

9. *What are the defining limits of each type in regard to slag composition?*

10. *How do these differences in slag figure out in financial margins per ton smelted?*

As these three questions are so intimately associated, I have grouped them. The slag-assays and analyses given in my first contribution* show the comparative losses, and as some of your readers will not have them at hand I repeat briefly:

	Reverberatory.		Blast-furnace.	
Slag.	1901.	Half of 1905.	1904.	Half o 1905.
Ag	0.348 oz.	0.352 oz.	0.116 oz.	0.114 oz.
	%	%	%	%
Cu	0.716	0.582	0.315	0.302
Fe	27.62	31.90	18.00	20.30
SiO_2	46.6	42.20	46.2	44.50
CaO	4.17	3.31	18.30	17.10
Al_2O_3	8.60	7.64	7.42	7.02
Matte.				
Ag	25.8 oz.	21.7 oz.	33.6 oz.	28.2 oz.
Cu	45.0%	39.5%	41.5%	36.2%

These are actual averages of all weekly average samples, and the assays for copper are electrolytic. They were made at the works of which Mr. Charles had charge at Butte during part of the period. The highest weekly average was 53% silica on reverberatory and 48.5% on the blast; the lowest was 40.0% silica on reverberatory and 42.2% on the blast. The drop in silica and increase in iron content of the slags in the half of 1905 resulted in an increase in tonnage in the reverberatory of 24%, and on the blast-furnaces of 10.3%. If we take the most favorable returns for the last half-year, we find the difference in favor of the blast-furnace slag as being: Ag 0.238 oz. and Cu 0.28%, at present prices of 64c. for the silver, and 20c. for the copper, this is equal to $1.28 per ton of slag. I think that the comparison of metal losses in the two slags should be made on the basis of the silica contents of the slags, as this is the material that has to be fluxed; figured on this basis the blast-furnace has the more silicious slag, and thus there is a further gain. The total cost of limestone for the blast-furnaces was 37c. per ton of ore.

While it is not "necessary" to combine all the silica in the reverberatory furnace, part of it being at times removable as 'floaters,' I do not think that this practice will appeal to the metallurgist, who has to consider the losses in silver, gold, and copper, in his ores, as it is altogether too probable that the uncombined silica will carry with it too much of the precious metals wherever the ores are of a good grade. If Mr. Charles' experience at the Bingham plant controverts this, it would be of general interest to know just what such 'floaters' assay in comparison to the grade of slag and matte.

11. *What method of charging do you advocate for a copper furnace (assuming the atmosphere to be oxidizing?)*

I was trying to provoke discussion not only as to the advantage or otherwise of mechanical charging, but also as to the best methods of doing this, and the best placing of the coke, fine, and coarse in the furnace. Naturally, when dumping from cars there is no room for discussion, the materials just "get there."

12. *Would you bind, in some manner, all fine for use in the blast-furnace? Incidentally, what are the difficulties of treating fine ore in the blast-furnace?*

If I had slime from a concentrating mill at hand, I would use this to bind as much of the fine material as possible, I would try every known or suggested binder, or sintering device, and I would send only such and so much material to the reverberatory plant as could not be used in the blast-furnace. Does it appeal to the scientific constructor to erect a beautiful furnace of fire-brick and steel to fill it with glisteuing sand for a bottom, and then subject the entire structure to a heat nearly double that

*MINING AND SCIENTIFIC PRESS, March 3, 1906.

of the ordinary operation, in order to smelt in that sand-bottom? And when the furnace is opened after that trial, and the breathless constructor gets his eye adjusted to the glare, is he happy to see his bridge-wall or flue, or some other equally important part of the structure, practically destroyed? And is it not a severe tax to have to build a 'by-pass' flue, often a very expensive one too, in order to conduct the excessive heat of this bottom-smelting operation around the boilers, and sometimes away from the regular stack, if it be of steel construction? Is that metallurgy, or is it something else? And suppose the furnace, flue, and stack bear up under the trial, and the bottom is finally also soaked with low-grade matte, and the furnace is, after a week or ten days, working up to normal charges, then if finally that beautiful quartz-bottom floats calmly up to the surface of the matte and appears at the slag-doors clamoring for exit, is it likely to make you feel cheerful? I say, give me the blast-furnace!

On Technical Writing.

The Editor:

Sir—It is singular but nevertheless true, that unscrupulous promoters and fake 'experts' have evolved a large number of words and expressions which, once recognized, serve as splendid danger signals to warn the would-be investor. The reason for this style of writing seems to be due to the fact that the unscientific brain can handle only generalities and the ignorant man bursts into parables and figures of speech. Also the gullible public would rather invest in "yellow metal," "white metal," or "red metal" "propositions" than in gold, silver, or copper mines, so the fake promoter and his 'expert' pass out the figures of speech to the appreciative throng. I have noticed that our best-known engineers and technical writers avoid these stock expressions and this fact makes it reasonably safe to ignore mine reports expressed in the lurid language of the spoofer.

Long acquaintance with the PRESS had convinced me that it never used any of these figures of speech. It was a shock, therefore, to find the expression "grass-roots," in your editorial, "A Question of Practical Mining" in the issue of June 8. This particular figure of speech may be considered to be the working tool of the parasites on the mining profession. Presumably it is used as a synonym of "surface," but it is inexact, and therefore unscientific. We all know that grass-roots are sometimes found at depths that would scarcely be credited. The figure is not beautiful, and, in fact, cannot be defended on any ground. Let us relegate the "grass-roots" along with the "true fissures" and other expressions to hat great "treasure house which Nature has prepared twlth such a lavish hand"—the brain of the spoofer.

G. B. W.

Salt Lake, June 17.

[The objection is well taken.—Editor.]

ACCORDING to Moissan, gold can be easily distilled in the electric furnace. It boils at a higher temperature than copper and condenses on the cold tube in filiform masses and microscopic crystals, which have all the characteristics of ordinary gold in fine division. In alloys of gold and copper, or gold and tin, the copper or tin distills before the gold. In distilling gold-tin alloys, a finely divided mixture of stannic oxide, lime and gold is obtained, having the color and properties of purple of Cassius.

The Odor of Metals.

Water chemically pure is a colorless, tasteless, odorless fluid; but in combination with other forms of matter it acquires each and all of these characteristics. Similarly it has been asserted by scientific authorities that metals free from alloys are odorless. In combination with other metals they frequently develop a strongly marked and sometimes a disagreeable smell, as in the case of copper alloys. Still the major premise was declared to hold until recently, when, according to report, as the result of exhaustive experiment, it has been established that all metals have their distinctive odors, which under set circumstances can be very perceptibly demonstrated. The proponent of the new theory is Herr Karl Gruhn, a Berlin metallurgical chemist and mineralogist, who has devoted much time and attention to the elucidation of his subject, and claims to have fully ascertained the origin and characteristics of the metallic odors. As a primary result of his experiments he asserts that even in its normal state each of the metals has its distinctive emanation, which is, however, so faintly perceptible as to have induced the assertion respecting its non-existence. This effluxion increases with the increase of temperature to a remarkable degree, and the rule applies equally to the royal as to the industrial metals. It is, however, most noticeable in connection with the latter, tin, copper, zinc, lead, and iron furnishing similar evidences of its application; and the odor is not at all affected by the oxidizing of the metal. Herr Gruhn found that each and all of the metals named when subjected to a high and sustained temperature gives out its odor in fullest strength after about an hour's treatment, but it then decreases, even when the temperature is still sustained, till the smell becomes as faint as before the temperature was raised. Then when the heat is withdrawn and the metal is allowed to cool, all trace of the odor disappears, as if it had been utterly driven off. An immediate return to high temperature re-develops the smell in only a faintly perceptible degree, but if a few hours are allowed to elapse before the metal is again heated it repeats in full strength all the phenomena attending the first test. It appears to have recovered from the exhaustion of its emanation and to have re-charged itself with the agents producing the odor. From these facts and the other data collected, Herr Gruhn arrives at a conclusion which challenges another commonly accepted belief. He disputes the theory that smells in their infinite variety are all produced by the effect upon the olfactory nerves of volatilized atoms from the effluxing substance which mix with the atmosphere, and so excite the sense. He says this is most decidedly not so in the case of metallic odors, which he affirms to be a property stored up by the substance and retained in a state almost quiescent till under the heat stimulus it is given off as are the radio-active properties of other minerals, and that as in the case of radium the emanations are unaccompanied by chemical change or loss of weight. The difference is that in the case of the odor there is an exhaust which is repaired by re-absorption, which in its turn is unaccompanied by chemical change or increase of weight. This relation to the radio-active properties of the uranian group and other allied minerals is indeed the asserted fact upon which Herr Gruhn lays chiefest stress, for he claims to have separated and isolated a metallic odor, and to have found that in its manifestations it establishes a strong affinity to the radio-active emanations of the rarer minerals.—*The Australian Mining Standard.*

SADDLE REEFS are characteristic of Bendigo; the Broken Hill lode is also claimed to be an anticlinal lode.

The Filtration of Slime by the Butters Method.

Written for the MINING AND SCIENTIFIC PRESS
By E. M. HAMILTON.

[CONTINUED FROM PAGE 789.]

METHOD OF PROCEDURE.—It is assumed that the filter-box is empty and one of the deep settlement-vats has been charged to its full capacity and has had time for settlement and decantation, and that the pulp therein is composed of about 1 part of slime to 2 of solution. This vat has six 12-in. iron plugs in the bottom, connected by iron rods to a screw and wheel attachment at the top of the vat, by which they may be opened or closed from above. The seats of these valves are all connected by tees to the 6-in. pipe of the centrifugal pump.

In order to put the filter in operation, the shift-man first opens up two of the plugs in the deep vat; he then returns to his station and opens the valve between the vat and the pump, and by turning his winches sets the 3-way valves in position to draw from the feed-vat and discharge into the bottom of the filter-box. As soon as the box is full the pump is stopped and the valve to the vacuum-drum is opened, putting each filter-leaf in direct communication with the vacuum-pump, which is now in action. Very soon a subsidence in the level of the pulp is apparent, due to the withdrawal of liquor through the filters; the 6-in. pump is then started again to supply fresh pulp to the box, and this is repeated at short intervals so as to keep the level of the pulp always above the line of permeability of the leaves. The solution, which is drawn from the pulp into the vacuum-drum continually, gravitates into the small sump and is periodically pumped into the precipitation vat, as before described.

The thickness of cake allowed to accumulate on the leaves varies from ¼ to 1 in. and these seem to be the economical limits; a thickness of over one inch necessitates a disproportionately longer time to collect and wash the cake, because the deposition becomes slower and slower with increased thickness, and the cake is more liable to drop from its support when the pulp is withdrawn; while if less than ¾ in. be used economy is again interfered with owing to the time needed for the subsequent operations being spent over too small a tonnage of material.

The time needed to accumulate a ¾-in. cake varies with the amount of moisture held in the pulp and with the quality of the slime, and may be from 15 minutes to an hour. The progress of formation is estimated from time to time by reaching the hand down below the level of the pulp and passing a short stick, such as a wooden match, through the cake and noting the measurement between the canvas surface and the finger and thumb.

As soon as the necessary point has been reached no more pulp is supplied to the box, but, the 3-way valves being reversed, the pump is again started, when the suction and delivery lines reverse their functions and the pulp remaining in the box is withdrawn and thrown back into the feed-vat. Immediately after starting this reverse motion of the pulp, a small valve is partially opened; this admits air to the vacuum-drum, and is so regulated that the mercury shall not register over 6 to 9 in. vacuum. The correct height for each kind of slime has to be ascertained by trial, the object being to have it as low as possible consistently with holding the cake in contact with the canvas. This is an important point; during the preliminary experiments it was found that when the box was emptied of pulp and the surfaces of the cakes exposed to the atmosphere, the passage of air through the pores rapidly dried the deposited slime and caused cracks, which rendered a perfect washing of the residue impossible. By lowering the vacuum to a point sufficient to hold the cake firmly in position and yet cause a minimum of air to pass through it, the difficulty was overcome and the cracking prevented.

When the box is nearly empty, the spray of solution is turned on, washing down the sides and bottom, and removing any light slime that may be adhering to them.

As soon as the last of the pulp has been removed, the main slime-valve is closed, and another one is opened to admit precipitated solution to the pump, by which means the filters with their adhering cakes are again completely

covered with liquor. As soon as this has been accomplished the air-valve is closed and the full vacuum a second time thrown on the leaves, so as to draw the wash-solution through the cake and displace the dissolved gold and silver contained therein, the level being maintained, as before, so as to keep all filtering surface covered with solution. The time required for this wash varies with the thickness of the cake and the quantity of solution that it is deemed desirable to pass through it. As a rule it is found that by drawing through an amount of liquor equal to twice the amount of moisture held in the cake a sufficient displacement is effected for practical requirements. In cases, however, where the solution accompanying the pulp is especially rich in gold and silver, a wash equal in quantity to three times that of the moisture in the cake may have to be given. When the washing process has been continued long enough, the vacuum is again lowered, and by resetting the 3-way valves the remaining solution is returned to the vat whence it came. (See diagram of pump connections, Fig. 4.) The solution-valve is then closed and water is thrown through the common 6-in. pipe until the filter-leaves are again submerged; the vacuum is put on for a few minutes to displace any solution that may be lying in the pipes, and is then entirely cut off and the valve is opened; water then enters each leaf through the vacuum connections, throwing off the cake, which drops to the bottom, and cleansing the canvas in preparation for the next charge. All that now remains to be done is to open the four discharge-doors and allow the contents, both water and hard slime, to gravitate to the waste-dam, open the end-doors, and wash out the interior thoroughly with the hose. After closing all the doors the filter is ready for a new charge.

Fig. 6.

Precipitated solution is not invariably used for displacing the valuable moisture in the cake; when the stock of solution in circulation through the plant is low, it is brought up to bulk by using water instead of solution for this purpose, in this case, of course, the necessity for a transferrence after washing is removed, and when the requisite number of tons of water has been drawn through the cake it is at once discharged, together with all the surplus water remaining in the box.

In localities where water is scarce it is not necessary to waste all the water standing in the box at the time the cake is thrown off; before dumping the residue, this water may be decanted to the level of the slime and stored for further use.

At the Minas Prietas plant of Charles Butters & Co., compressed air alone is used for dropping the cake, and the residue is run out to the dump in cars. The use of water and air together, however, as already described, is considered an improvement.

WORKING COSTS AT VIRGINIA CITY.—The two chief items of expense are power and labor.

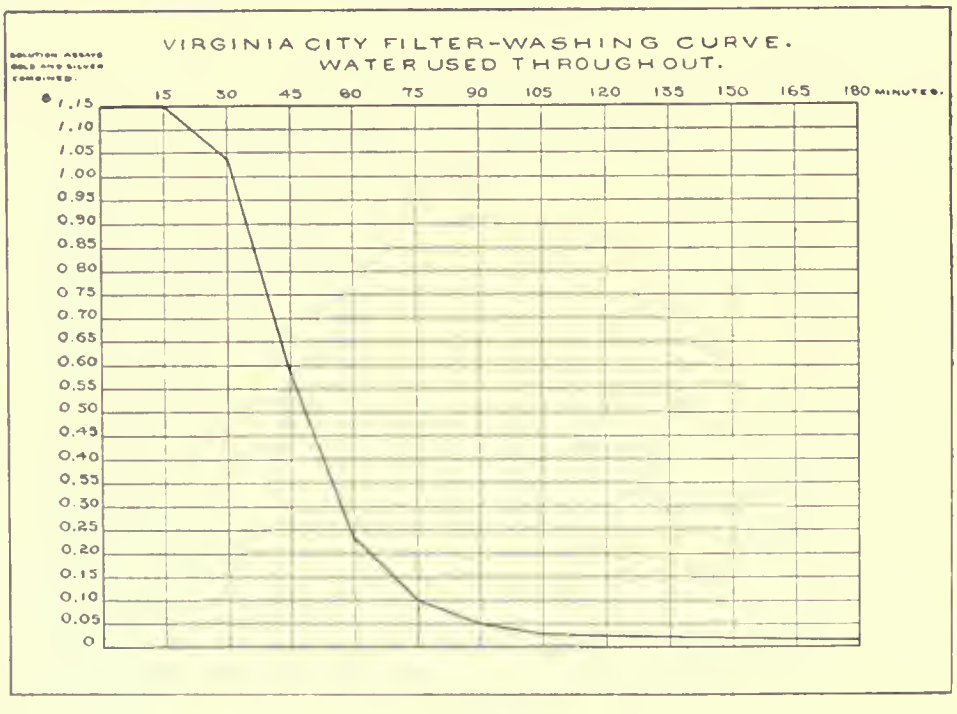

Fig. 7.

1. Labor.—As already stated, the filter requires only one man on each shift, or three men for 24 hours. Taking the rate of wages as $3 per 8-hour shift the labor bill will amount to $9 for handling 150 tons of slime, or 6c. per ton.

2. Power.—The principal divisions are, the 6-in.

centrifugal, the 4-in. centrifugal, the vacuum-pump, and the service-pump for supplying the tank used to furnish hose-pressure for sluicing out the residue. The water used for filling the box and for throwing off the cake is gravitated into the plant and uses no power.

The 6-in. centrifugal makes 1,440 r.p.m., and when running takes 25 h.p. During one operation of the filter this pump runs as follows:

Operation.	Minutes.
Filling with pulp	12
Maintaining pulp at one level	5
Emptying	12
Filling with solution	12
Maintaining constant level	5
Emptying	12
Filling with water	12
Total	70

The power used is therefore equivalent to 29 h.p. hr. Power, as supplied by the Electric Power Co., costs approximately 1c. per h.p.hr., so the cost of running the 6-in. pump is 29c. for each charge, or 1.54c. per ton.

The 4-in. centrifugal pump makes 1,600 r.p.m. and uses 10 h.p. During one operation it runs 34 min., equal to 6.5 h.p.hr., giving a cost of 5.6c. for each charge, or 0.3c. per ton of slime.

The vacuum-pump runs 2 hr. 20 min. for each charge, taking 8 h.p. or 18.6 h.p.hr., equal to 18.6c., or 1c. per ton.

The water-service pump runs about 10 hr. per day, using 3 h.p., or 30 h.p.hr., which, divided over 150 tons of slime, gives a cost of 0.2c. per ton.

Thus the total cost of power, per ton of slime, is as follows:

	Per ton.
6-in. pump	$0.0154
4-in. pump	0.0030
Vacuum-pump	0.0100
Water-service	0.0020
Total	$0.0304

3. Repairs.—The only repairs of any consequence are those to the 6-in. pump. About once a month this pump needs:

1 pair of liners	$2.00
1 disc	3.35
1 shaft	1.80
Mechanic's labor (2 hr. at 50c.)	1.00
Total	$8.15

This for 4,500 tons gives a cost of 0.2c. per ton. The running expenses will be:

	Per ton.
Labor	$0.0600
Power	0.0301
Repairs	0.0020
Treating leaves with acid	0.0150
Total	$0.1074

These figures were compiled when only one filter-box was in use; since then a second has been installed, and as one man attends to both, the cost of labor has come down to 3c. per ton, showing a total working cost of about 8c. per ton of slime.

NOTES ON WORKING.—It will be noticed from what has been said about washing, that the practice at Virginia City at this time was to use either a solution-wash or a water-wash, but not both on any given charge. The reason for this was that the particular slime being treated was such that it would not stand being twice exposed to the action of the air without cracks forming in the cake. This, however, is not the case with all slimes, and it is usually found that a wash of solution may first be given and then a further period of water-wash. Where possible the latter arrangement is preferable, because, as a rule, when using water alone it is impossible to give a sufficient quantity for effective displacement without over-stocking the plant with weak solution, which finally has to be run to waste; and the giving of an adequate wash with barren solution, followed by a quantity of water sufficient to compensate for the daily losses in the stock, and thus displacing as much as possible of the cyanide remaining in the cake, generally results in a better saving of cyanide than is obtained by the Virginia City practice. Another method, where it is not possible to give the double wash, is to add to the wash-solution each day just enough water to maintain the balance of stock liquor in the plant; this gives more uniform results than alternating between solution and water, and is sometimes preferable.

With regard to the time necessary for washing the cake, the important point is the quantity of solution that is drawn through it; in a given time this varies between wide limits with different classes of slime. Fig. 6 and 7 are two charts of the results of the wash at Virginia City. There is an interval of two or three weeks between them. In one of them solution alone was used, and in the other, water. The rate of percolation was 18 tons per hour in each case; weight of dry slime, 19 tons; moisture in the cake, 40%. The samples of solution were caught in a trap below the main vacuum-pipe, capable of holding at least 20 assay-tons, which quantity was used for each assay. Fig. 8 shows a similar chart, made at the Butters Divisadero Mines, in Salvador. Here the ore is ground in tube-mills to an agitation product of which about 85% will pass a 200-mesh screen, and the whole of the pulp finally reaches the filter. In this instance the rate of percolation was 28 tons per hour; quantity of dry slime, 18 tons; moisture in the cake, 28 per cent.

When considering the contents of the solution draining from the filter just before discharging, it will be obvious that this assay does not usually represent the soluble gold and silver left in the cake. Where water or barren solution is used for the wash no portion of the residual moisture will assay as high as that which has already come out, and the average of it will be much lower; for example, if the last solution from the cake should assay, let us suppose, 20c. per ton, the moisture remaining behind would probably average only 10c. or less, and as there will be only half a ton of it contained in a ton of dry slime the assay of the residue would be raised thereby only 5c. per ton, an increase that could hardly be detected by the assay methods ordinarily in use. Five cents per ton, however, is 5c., whether it can be shown by the assay or not, so that when fixing the time necessary for washing, it will be well, instead of depending on what is usually known as the 'washed-residue assay,' to give a trial wash of excessive duration once or twice a month, taking samples of the issuing solution periodically and plotting as a curve the figures so obtained; it will then be easy, if the rate of percolation is known, to set the value recovered at any given point against the cost of obtaining it, and in this way to determine the profitable limit to place on the period of washing.

The question of saving cyanide will not enter largely into this matter of wash-duration, because the cyanide can only be displaced by water, and the amount of the latter used, as already pointed out, will be determined by the daily losses of moisture from the plant, and thus cannot be varied at will except at the expense of running to waste weak cyanide solution from some other part of the plant. Several curves showing the progressive elimination of cyanide from the cake have been made, but as they were not consistent with the gold and silver curves made at the same time they are not given here, and the matter is still under investigation.

The following is a table of the time needed (with a

¾-in. cake) for the various operations, taken directly from the filter log-book at Virginia City:

	Hr.	Min.
Filling, and taking on cake	0	45
Removing surplus pulp and re-filling with solution	0	25
Drawing wash-solution through cake	1	15
Replacing solution by water, throwing off cake, discharging, sluicing out, and re-closing doors	0	35
Total time of operation	3	0

The percentage of moisture held by the cake before being detached from its support is from 35 to 40% in this case, though the average for an ordinary slime would be nearer 33 per cent.

The box contains 94 filter-leaves, and each leaf carries about 400 lb. dry slime, giving a capacity of 19 tons at each operation, or 150 tons per 24 hours. With certain kinds of slime the capacity of a filter of this size may be as much as 25 tons per charge, making 200 tons or more per 24 hours.

The consistency of the pulp fed to the filter has an important bearing on the efficiency of the latter; the thicker it is, the better it will suspend fine sandy material and form a homogeneous mass giving a uniform cake, and also the less time it will need to form the cake and therefore the greater will be the capacity of a given filter-unit in a given time. Of course, there is a limit in the consistency, beyond which the thickness would cause trouble by clogging the pipe-lines, and a useful point to aim at is a specific gravity of from 1.3 to 1.4.

At the start there was one point in connection with the working of the filter that was not apparent. It was found that after a few months the permeability of the leaves began to grow less, thus necessitating a longer time for loading and also for passing the wash. After a careful examination, it was traced to a formation of calcium carbonate in the fibre of the canvas and more especially on its exterior surface. This was found to be easily removed by immersing the leaves in a dilute solution of hydrochloric acid. A rectangular wooden vat was prepared capable of holding 7 or 8 leaves at a time, and this was filled with a solution containing about 2% commercial muriatic acid in water. Seven leaves are removed each day, their places being filled by spares. They are placed in the acid bath and allowed to remain for about six hours, at the end of which time they are removed, drained, and placed in a water-tank to stop the action of the acid. In this way each leaf is treated about twice per month.

If this is not sufficient to restore the leaves to a perfect working condition, the strength of the acid may be increased to 5 or 6%, and a vacuum arrangement attached to them for drawing the solution through the fibre repeatedly, until all the deposit is removed. Instead of continually adding acid to re-strengthen the bath, it is better to turn the whole liquor to waste at short intervals, because it is liable soon to get charged with salts, which, if not properly washed out from the leaves with water, may be precipitated in the fibre of the canvas when next it comes in contact with alkaline solution.

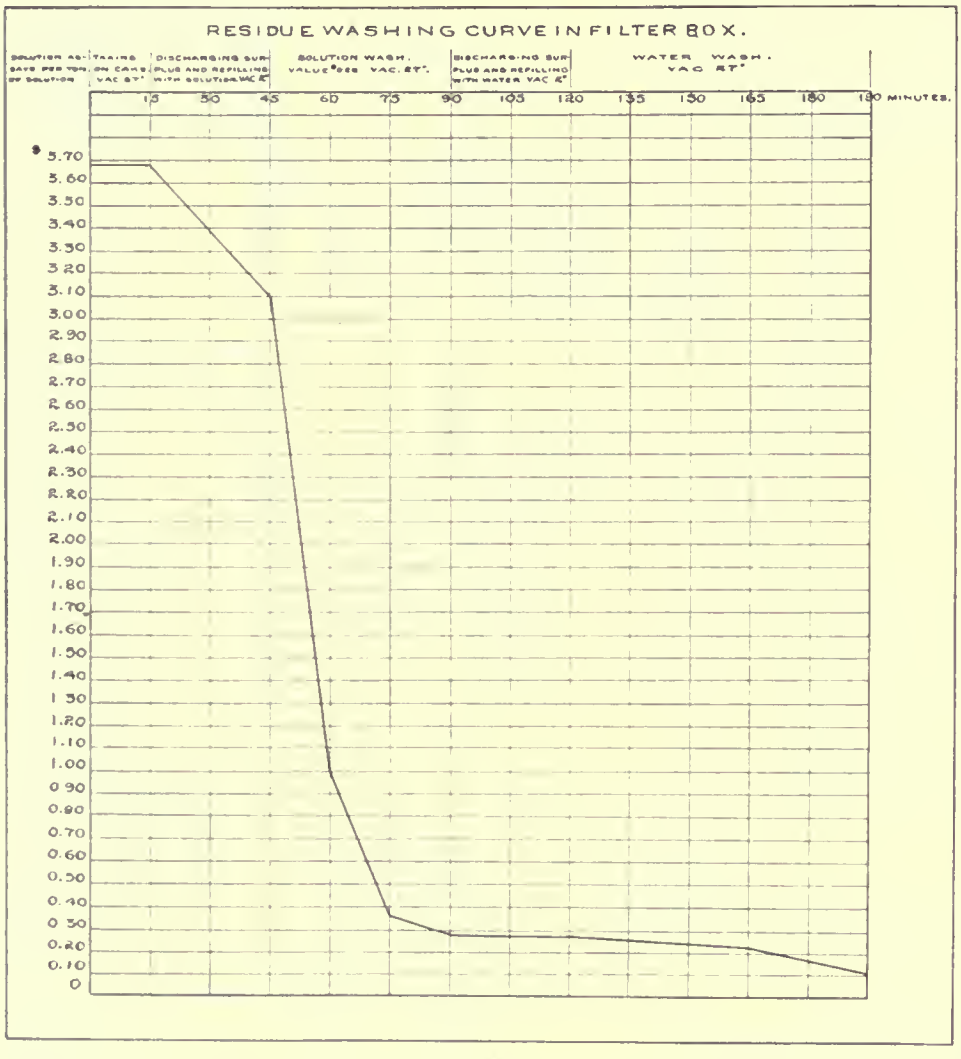

Fig. 8.

To get the highest efficiency from this filter it is important to make the transfer of pulp and solution as rapidly as possible, and this for two reasons: (1) It materially increases the capacity of a given filter-unit and thus decreases the working costs per ton of slime in the item of labor, and (2) it lessens the liability of the cake to crack when exposed to the air, and in the case of slime that has an exceptional predisposition to crack, it renders it possible to give a double wash, of solution followed by water, when otherwise only a single wash could have been applied.

For a rapid transfer of the pulp and solution the gravity system of filling and emptying the box gives excellent results. The general arrangement is shown in Fig. 9, though there a water-wash only is provided for. Usually a second vat at the level of *C* is provided to receive the surplus solution, and also a third vat for surplus water where the double wash is given and where the water is sufficiently valuable to be saved for re-use. The method of working is to fill the box with pulp by gravity through two or more 6-in. pipe-lines from the feed-vat above; then after taking on the cake to let out the surplus through the discharge gates into vat *C*, which has a light stirring gear to keep the slime in suspension while it is being thrown back by a 4-in. centrifugal pump to the feed-vat above. The same process is then repeated with

the wash solution, and again with the water if necessary, each in turn being thrown back to the higher level by the same 4-in. pump. In this way the box may be filled in 4 or 5 minutes and emptied in 3 minutes, so that the cake is exposed to the air only about 8 minutes for each transfer; this is a great advantage where a slime shows a tendency to crack. The arrangement is chiefly applicable where the mill-site is on the side of a hill; for level sites the pump-system is usually more suitable. By the latter, of course, results similar to those of the gravitation system may be obtained by using a sufficiently large pump and pipe-line, but where the site is favorable to gravitation this has the advantage of a rapidity of transfer without the sudden switching on and off of a heavy load at short intervals with its attendant strains on the source of power and the machinery in general, the power used being comparatively small in amount and evenly distributed over a long period of time. The method has been in use at the cyanide plant of the Butters Copala Mines, in Sinaloa, Mexico, for over 12 months and has given entire satisfaction.

The Butters patent filter is now well past the experimental stage, and its advent may be said to mark the beginning of a new era in the history of ore-slime treatment, and to open up possibilities unknown a few years ago. The time may even be not far distant when slime from gold ores will be treated by cyanide solution directly in the vacuum-filter, so that all the expensive agitation and decantation machinery now in use can be discarded.

It would perhaps be too sanguine to hope that the slimes of silver ore may also be treated in the same way in the near future, because, as far as our present experience goes, such ore requires a much longer time in contact with cyanide than would be practicable in any filter, but as soon as some means is found of accelerating the solution of silver in cyanide, then there is little doubt that agitation and decantation will give place to treatment by leaching in vacuum-filters.

A DISPATCH from Ottawa, Canada, states that the Georgian Bay Canal Commission has practically completed, at a cost of some $600,000, a thorough survey of the proposed 21-ft. waterway from Georgian bay to Montreal by way of the French river, Nipissing, and Ottawa river. The engineers of the commission have not compiled a final estimate as to the whole cost of the canal, but from information now available it is stated that the total expenditure required for a continuous and easily navigable waterway, with a minimum depth of 21 ft. from Georgian bay to tidewater, will be close to $105,000,000. It is said that the canal will shorten the distance from Fort William, on Georgian bay, to Montreal by over 400 miles. It is estimated that with the completion of the canal there will be 500,000 h.p. available along its course—almost as much as is available at Niagara. With so much cheap power available and with its great resources of iron ore and timber, the Ottawa valley is expected to become one of the greatest manufacturing centres of the continent. It will be linked with the system of water-transport that has done so much for the regions bordering the Great Lakes.

RECOVERY OF COPPER FROM SCRAP.—A comparatively new industry has sprung up in the refining of nonferrous scrap metal and the present high prices asked for all metals of this class has led to unusual activity in the scrap market. Scrap producers are anxious to realize on their waste metal and competition is keen for the purchase of raw material by the refiners. Copper is getting its due share of attention, and some care is necessary now in handling the ever increasing traffic in copper and brass scrap. Brass and other alloy scrap is recovered by re-melting in crucibles with new metal. Fine particles of brass, such as occur in ashes, skimmings, and sweepings, are recovered by a system of washing and jigging.

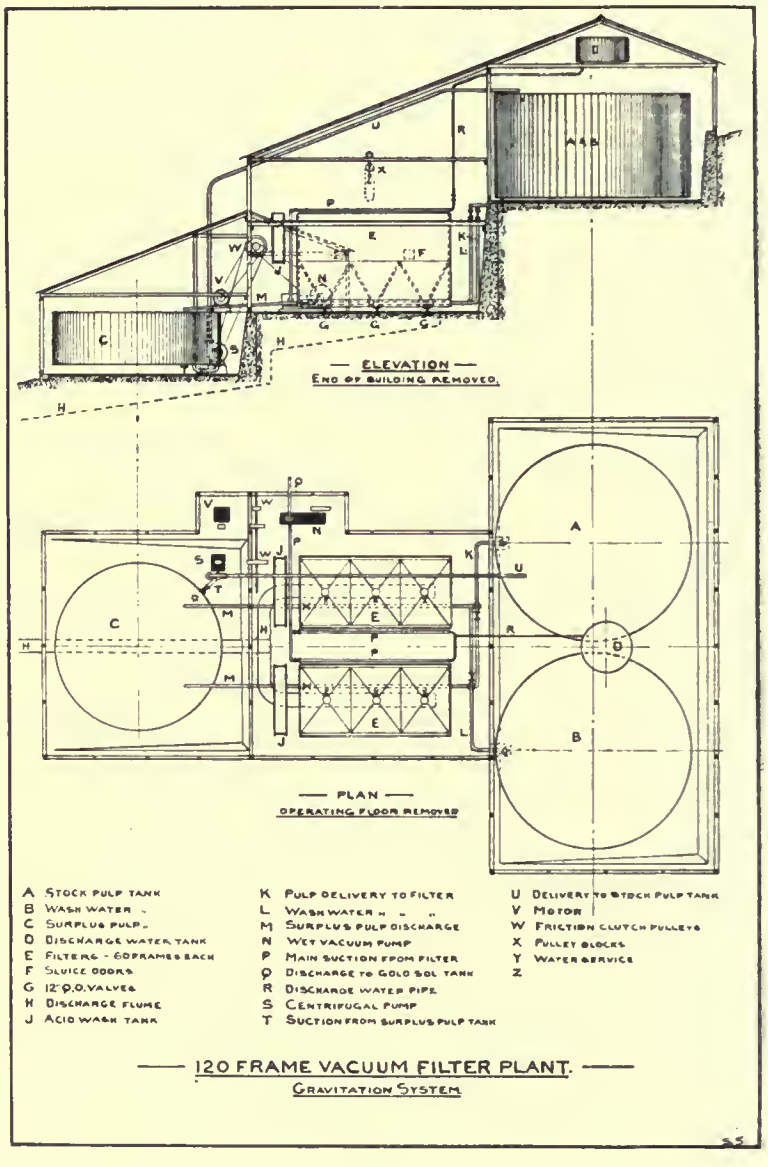

Fig. 9.

Concentrate obtained from jigging processes is smelted in a reverberatory furnace or melted down in crucible or oil-burning furnaces and cast into ingots. Copper scrap is treated differently, according to the character of the material. The copper may be in the metallic state, as in trimmings from copper sheet, borings, grindings, punchings, etc., or it may exist in chemical combination with some other element, as in copper scale or blue vitriol. Metallic scrap copper may be melted in reverberatory furnaces of similar design to those used in the copper mining districts. The slag skimmed off consists of impurities originally contained in the charge, and combinations of copper with oxygen and the fire-brick lining of furnace. The slag may contain from 30 to 70% copper, which is recovered by smelting in a cupola or small round water jacketed blast-furnaces.

Henry G. Hanks.

Henry G. Hanks, who passed away on June 11 at the Mininger Sanitarium, Alameda, was one of the old-time citizens of San Francisco. Born at Cleveland, Ohio, on May 12, 1826, he early gratified his desire for travel by shipping before the mast as a sailor and so visited India and South America. He came to California in 1852 and was prominently identified with the early history of San Francisco.

It was in his chosen field of geology and mineralogy, however, that he achieved most success. He was associated with J. M. Hutchings, of Yosemite Valley fame, in the Owens River country in 1863 and 1864. As Deputy U. S. Mineral Surveyor he laid out the town of San Carlos (near the present town of Bishop Creek), erected a five-stamp mill, and had charge of the operations of a company engaged in the development of that region. Returning to San Francisco in 1866, he established the custom assay-office and laboratories still conducted by his son.

At the Pacific Chemical Works at North Beach, about 1876, he was one of the first to refine borax, then produced from the waters of Clear Lake. He was appointed to represent California at the Paris Exposition of 1878 and had charge of collecting and arranging the valuable mineral collection sent there from this State at that time. He was later placed in charge of the entire mineral exhibit of the United States at this exposition. Prominent in the movement to organize a State Mining Bureau, he was appointed first State Mineralogist in 1880, a position which he held for six years. He compiled and published the first six reports of the Bureau. The second Annual Report dealt largely with the question of hydraulic mining in the State, and appeared just at the time of the injunction restraining such mines from working. The third Annual Report was a monograph on borax. In the fourth Annual Report he made up the first complete list of minerals found in California with the localities of each, their commercial value, and uses.

He was a frequent contributor to technical journals and to the proceedings of many scientific societies. He was one of the early writers on 'rusty' gold in company with the late Melville Atwood. The mineral Hanksite (a sulpho-carbonate of soda, which he had discovered in the borax marshes of the San Bernardino desert) is named in his honor. During his residence in California he accumulated three collections of minerals. The first was purchased by the late James Flood and presented to the State University. The second passed into the hands of the Kimball brothers of San Diego, and the last was destroyed at his residence in the fire of last year.

Mr. Hanks early commenced the accumulation of a library bearing on geology, mineralogy, chemistry, and metallurgy. As he grew older and retired from the active cares of business, he was able to give more time to this work and his library (consisting of over 4,000 volumes) was undoubtedly one of the most complete of its kind on the Coast.

Among the more important of his published writings may be mentioned his 'Notes on Pacific Coast Earthquakes,' 'Deep Channels of the Pacific Slope,' a monograph on 'Magnesite,' historical articles on 'Gold' and 'Mercury.'

Mr. Hanks had visited Europe several times and was personally acquainted with many scientific men on the other side. He was a Fellow of the Royal Geological Society and of the Royal Microscopical Society of England, had received a certificate of merit from the Ecole de Mines of Paris in connection with work done at the Exposition of 1878.

Decisions Relating to Mining.

Specially Reported for the MINING AND SCIENTIFIC PRESS.

A servant who continues to work after discovering the defect or danger incident to such work, or where such danger is patent and open to ordinary observation, assumes the risk of consequences and continues to work in such place at his own peril.

Pioneer Min. &c. Co. *v.* Smith, (Ala.) 43 So. 561. (April, '07).

The general rules as to the relative duty of master and servant as to knowledge of danger applies to miners and mine owners. But in all such cases they do not stand upon an equal footing, even when they have equal knowledge of the danger. The position of the servant is one of subordination and obedience to the master, and he has the right to rely upon the superior skill of the master, and he is not entirely free to act upon his own suspicions of danger. Where a servant, being ordered to work in a particular place, obeys and is injured, he will not be held to be guilty of contributory negligence, unless the danger is so glaring that a reasonably prudent person would not have entered into it.

Pioneer Min. &c. Co. *v.* Smith, (Ala.) 43 So. 561. (April, '07.)

A defect in the roof of a mine entry was reported to the mine owner, who thereupon attempted to remedy it, and then assured the miners that the roof was no longer dangerous. A miner while at work in the mine was afterward killed by the falling of that part of the roof where the repairs had been made. It was held that the failure of such miner to examine the roof, after the repair, was not negligence as a matter of law, where it was not shown that he knew of the danger, or that the defect was open and glaring to ordinary observation.

Pioneer Min. &c. Co. *v.* Smith, (Ala.) 43 So. 561 (April, '07.)

One mine owner cannot make the adjoining land subservient to his own as a mere matter of convenience to himself for dumping the waste from his mine.

White *v.* Lansing, 103 N. Y. S. 1040. (May, '07.)

The laws govering the location of placer claims on the public domain apply with equal force to the location of oil claims.

Woolfskill *v.* Smith, (Cal.) 89 Pac. 1001. (March, '07.)

Public lands, upon which an oil company had drilled two artesian wells and which was then abandoned, reverted with such wells to its original status as unoccupied and Government land.

Woolfskill *v.* Smith, (Cal.) 89 Pac. 1001. (March, '07.)

A hoisting engine used at the top of an incline for the purpose of drawing rock and coal-cars to haul material from the mine, though outside of the mine, was a part of such mine, under the statute of Illinois, which made it the duty of the mine manager to see that all dangerous places above and below were properly marked, and danger signals displayed when required, and the mine owner was liable for injury to a miner for failure to have such hoisting engine inspected and marked dangerous as required by the statute.

Spring Val. Coal Co. *v.* Greig, (Ill.) 80 N.E. 1042. (April, '07.)

An option given on coal underlying certain land without consideration, is completed by an acceptance before the option was withdrawn.

Murphy *v.* Thompson (Ky.) 101 S. W. 964. (May '07.)

The courts are liberal in granting injunctive relief in mining litigation, in order that neither party may gain any advantage over the other, during such litigation, by force or violation.

Salford *v.* Fleming, (Idaho) 89 Pac. 827. (April, '07.)

Old and New Methods at Guanajuato, Mexico.

Written for the MINING AND SCIENTIFIC PRESS
By T. A. RICKARD.

Reference has been made to the milling practice of the Guanajuato Reduction & Mines Co. in speaking of the Bustos plant. It deserves further consideration. Although the property was acquired in January, 1904, it was not until February, 1905, that it was decided to build 80 stamps, rushing the erection of five of them so as to afford experimental data during the construction period. Many tests, on a large as well as a small scale, had already demonstrated that a high extraction of both silver and gold could be obtained from the ore by cyanidation, and the experimental plant became of great service in testing ores from different parts of the company's properties, as well as to suggest the detail manipulation best adapted for the main plant, then under construction. The mines are a mile from Guanajuato, and there are no streams available for disposal of the tailing; nor is there the space necessary for accumulating residue on a large scale. It became necessary to discharge the tailing into the main stream of the district one mile from the mines,

Pipe for Conveying Tailing.

and this meant the transportation of all ores through the heart of the City over an expensive railroad system, or the complete separation of the stamp-mill from the cyanide plant, the latter to be placed upon the main stream.

The Homestake system, of conveying the tailing in a cast-iron sewer-pipe, was adopted; it is an 8-in. water-pipe of bell and spigot type, asphalted, laid for its first few hundred feet at a grade of 3%, then flattening to 2¼%. As it was desirable to settle and return for re-use as much of the water coming from the concentrators as possible, allowing the thick pulp only to pass through the pipe, and to determine to what point such thickening was possible, several hundred feet of the pipe to be employed in this work were put together and laid out upon the actual grade. Arrangements were made to circulate any given quantity of sand, crushed in the stamps of the experimental plant already installed, through this pipe-line at any desired degree of dilution. Pulp was first tried at a normal dilution of 8 of water to 1 of sand, just as it came from the tail of the concentrator tables; the water was then decanted by successive steps, thickening the pulp, and several runs were made under these varying conditions. It was desired to remove a maximum of one-half of the original water, and in the experiments the 8 to 1 pulp was reduced to 2.5 to 1, and so successfully that not only was the pipe not clogged with sand, but the pulp at that thickness had such rapidity of flow that it readily carried nuts and other heavy objects without interrupting the stream. Tests made by Mr. Carlos Van Law prove that pulp which has passed through a 30-mesh screen, with water in the proportion of 7½ to 1, will flow through a launder of square cross-section, made of rough boards, set on a grade of 1½%. With a V-shaped wooden launder, such pulp will flow at less grade and with less water. The area of the wet perimeter is the factor.

This problem settled, the process was outlined as follows: The ore is transported over a railroad from the mines in hopper-bottom cars, which discharge into a large bin at the crusher plant. It is then passed through a No. 5 D. Gates crusher to 2-in. size, discharging over a picking-belt for removal of waste, then re-crushed by a short-head No. 4 Gates crusher to 1-in. ring, then removed by conveyor-belts to the mill-bins, where it is distributed by cars, this (owing to cheap labor), proving more economical than the use of a system of conveyor-belts over the top of a bin with automatic trippers. The mill-bin has a capacity for five days, which, together with the large bin at the crusher plant, affords sufficient storage of ore.

The ore is then crushed under eighty 1,050-lb. stamps of Allis-Chalmers make. The mortars are set on a concrete foundation, the anvil-block being cast as an integral part of the mortar. The latter has a steel liner, two inches thick, but there is 13.5 in. of metal below the liner. Between the anvil-block and the concrete a quarter-inch sheet of rubber is spread. The mortar has a broad base—36 in. wide—provided with strong ribs at the sides.

The 30-mesh pulp resulting from the stamping is concentrated over Wilfley tables, a considerable amount of middling produced being removed for re-grinding in an Abbé tube-mill and subsequent treatment over separate concentrator tables. The tailing from all the machines drops into concrete launders and passes to the cones, where about half of the water is removed for use in the mill. The thickened tailing then enters an 8-in. cast-iron pipe, laid on the grade above mentioned, and goes to the classifiers in the Hacienda Flores, situated upon the main channel of the Guanajuato river. The classifiers are all of the Homestake type, two sets of cones being used, the lower one taking the bottom product of the upper. The overflow from both sets of cones goes to the slime-plant, the lower cone having an ascending current of water.

The sand coming from the bottom of the lower cones is distributed, by the Butters & Mein device, into either of two receiving-vats, each of 350 tons capacity. These were planned to serve an ultimate capacity of 500 tons daily, with the slime separated.

The receiving-vats are alternately filled and drained, the discharge being made through bottom gates onto ascending conveyor-belts, which pass over the centre of the line of eight leaching-vats, each of the same size as the receiving-vats. In these a 14-day treatment is given with 0.5% cyanide solution, the sand being then washed and ultimately discharged on conveyor-belts (running under the vats), which deliver either into the river during the rainy season, or to elevated storage-piles during the dry season, to be sluiced during the succeeding rainy season.

The slime from the classifying cones is treated by agi-

tation with mechanical stirring and large centrifugal pumps, which draw from the bottoms of the vats and discharge over the tops, the total time of treatment being four days. After the final wash the slime is pumped into settling-vats 30 ft. high, where a further decantation occurs before the slime is discharged, with a very small percentage of moisture, into the river.

The entire plant, both the stamp-mill and cyanide annex, is designed so that it can be doubled, when the stamp-mill will take a back-to-back form, 80 stamps with their concentrators being on either side of the bins. The classifying-cones and the receiving-vats of the cyanide annex are of sufficient size already for a 500-ton plant, it being necessary only to add another line of eight leaching-vats and the corresponding slime-vats to bring the cyanide plant to the larger capacity mentioned.

For roofing, corrugated galvanized iron on a steel frame is preferred. As there is no load of snow to fear, it is possible to use a light roof-truss. The native tile is cheaper, but it requires a heavier construction, and does not afford as complete protection. The Northerner will remark the lavishness of the masonry about the mines and mills in Mexico. It is the cheapest kind of construction and the native wood is usually poor; it will twist and untwist as the dry and wet seasons succeed each other, making it an unsatisfactory structural material.

At the time of my visit there were 120 stamps in operation in the Guanajuato district, and there were 205 tons being treated daily by cyanidation and 25 to 30 tons by *patio*. Thus does the new drive out the old. In 1887 there were 34 *patios* at work; now there are only two.

In regard to cost in the *patio* process, I have the following data from the Hacienda de San Julio at Pachuca:

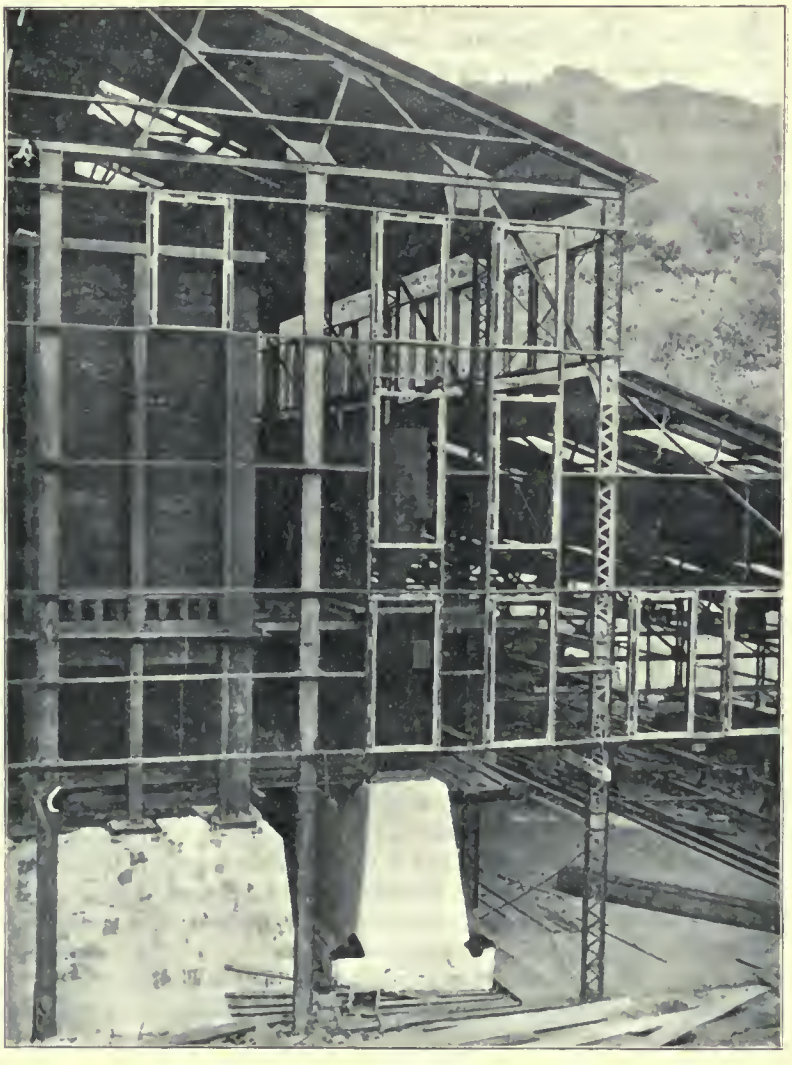
	Pesos.
Crushing, to pass 60-mesh in Chilean mills, with overflow discharge	3.60
Maintenance	0.50
Salt, 5%, or 10 kg. per ton	1.75
Copper sulphate. Loss, 0.5%	1.25
Mercury. Loss, 1½ kg. for each kilogram of silver	4.38
Transport from the mine	1.08
Total	12.56

The ore is bought on the dump, therefore the cost of transport is included. Salt costs 35 *pesos* per ton; copper sulphate, 250 *pesos* per ton; and mercury, 3.41 *pesos* per kllo. The average losses for the year were 1.18 to 1.50 kllo. per kilogram of silver extracted; the loss of silver being 6.13 to 10.92% on the clean ore, and 15.83 to 29.13% on the galena ore. The *patio* process waits on the completion of the chemical reactions, and it is therefore continued until extraction ceases. Time is not considered; in winter it requires 20% longer by reason of the lower temperature of the air.

At Parral, in Chihuahua, with the Russell process, using hyposulphite, the cost of lixivintion and roasting is 11 *pesos*, but the recovery is not as high as it is with amalgamation in the *patio*, where the cost is 11 to 14 *pesos*, varying according to the manganese content of the ore.

At Pachuca, by Mexican methods, the cost of mining and sorting ore nmounts to 15 *pesos* per ton; the transport to the *patio* and the treatment there makes a further cost of 14 *pesos*, not including losses or the expense of marketing the product. By stamp-milling, pan amalgamation, and concentration, the cost at Guanajuato was 8 *pesos;* and now by stamp-milling and cyanidation the cost is 5.85 *pesos*. That of mining and development is 3.50 to 4.50 *pesos*, so that the total present cost is about 10 *pesos*, or $5 per ton.

At the time of my visit there were about 200 men, women, and children in the Anglo-American colony at Guanajuato, the American element predominating. Of the 125 men employed, 75 to 80 were technical men, of good training. This made a strong piece of mental machinery for industrial development.



Bustos Mill, When in Course of Construction.

BRAZILIAN SAND.—Contrary to the impression which seems to exist in the United States, there has been no increase in the export tax on monazite in Brazil, although the practical effect of the course of the business in this country has been such as to lead to conditions amounting to an increase. The federal authorities continue to charge about 50% on exports, or rather they allow the person handling the sand 50% of the sale value, taking the balance. In Bahia the tax remains at 27% ad valorem plus $4.85 per ton specific export tax. In Espirito Santo the tax has been 20% ad valorem plus £1, £2, or £3 per ton specific duty, depending upon whether the exporter, a third person, or the Government owns the ground from which the sand is taken. The State legislative assembly of Espirito Santo has been debating the question of an increase in the tax imposed by that State.

Pan Amalgamation.

Written for the MINING AND SCIENTIFIC PRESS
By H. W. BANGLE.

As this is a process that in practice gives results generally lower than expected from tests made before actual milling a few preliminary remarks will be in order. In the first place, laboratory tests on a small scale are frequently executed by grinding the pulverized ore in a rough porcelain mortar, using a great excess of mercury, which is unusually clean as compared with that used over and over again in the mill, the surface of which shows it to be contaminated by chlorides, refractory sulphides, oxides, grease, etc. The porcelain mortar does not fulfill one of the important conditions obtaining in practice because it does not act chemically upon the ore, being like a stone *arrastre* in that respect, contributing no iron salts to the charge as an iron mortar would.

It is a known fact that the old Mexican stone *arrastre* is slower but surer in many instances than the modern pan, for the Mexican valued a good cheap extraction rather than a high one with a faster and more expensive machine, time being the least of his troubles. The *arrastre* served him for grinder, pan, and settler, all combined in one machine. A pan is not a grinding machine in the full sense of the word, yet some grinding is necessary, unless thorough sliming has been accomplished previously. The first runs, after an installation of the pan process, are usually short ones, due to a certain amount of experimenting being necessary. Leakage also tends to shorten them. Up to a certain point, invariably, some improvements can be made after the first trials. At Los Grados, in Guerrero, great care was taken to have every joint of the pan and settler-bottoms fit absolutely, the bottoms being sectional for mule-back transportation and necessitating greater care, therefore, to give both strength and tightness. Even then there was a leakage of mercury, although every joint of the sections had previously been smoothed by emery paper and cleaned with petroleum and oil, and every bolt tightened two or three times with a wrench. If there is the slightest opening for leakage, mercury will find it. It is possible to calk the pan by using thin pieces of copper sheeting as wedges, but the loss will in time be remedied by an amalgam filling from filtering or by its being pressed in, forming a hard cementing material.

The latest style of pan and settler is made with overhead shafting, pulleys, and belting, as against the older type of underneath beveled gearing. The former type allows the pans to set closer to the floor, and the working parts are at all times in sight of the operator. The sills for such pans and settlers are frequently laid directly on the ground, neglecting to leave a cement floor beneath, or even space enough for a man to crawl under them. Observe these precautions; it will be a convenience and save your mercury. It will eliminate the doubt whether a loss is from flouring or leakage. For the first two days run we had a 'loss' of four pounds of mercury per ton of ore, due to leakage and flouring. The leakage was remedied to a large extent and much mercury was recovered, until the total loss (including retorting) was only 1½ lb. per ton and that due largely to flouring. Some flouring will occur even under ideal working conditions.

Books on the subject rarely explain how much of the several indispensable chemicals are to be used in the process; they are merely content with the final figures as taught by experience. It may prove equally interesting, if not profitable, to quote a specific case by which I was guided at Los Grados. I shall first give the three principal reactions underlying the process. If they can be regulated, one need not bother with the innumerable minor reactions that take place under as many changing conditions.

1. $2NaCl + CuSO_4 = CuCl_2 + Na_2SO_4$
2. $CuCl_2 + Ag_2S = 2AgCl + CuS$
3. $AgCl + Hg = HgCl + Ag$ (soluble in the excess Hg used in the pans).

It will be understood that the process is used to decompose the various silver minerals, which are suphides, or even more complex, such as sulph-antimonides and sulph-arsenides of silver, but which by heat and chemical reactions are somehow finally made to act as Ag_2S. If one has AgCl, native silver, or free gold in his ore, he need not worry about good results, and some other processes might be much better. The pan-amalgamation process gives the best results for silver rather than gold, just as the cyanide process gives best results for gold rather than silver. If the process is to be used on ore containing much gold, inasmuch as the chemicals retard the amalgamation of gold, a previous use of copper plates may remove most of the nobler metal, as they catch relatively more gold than silver, as a rule.

Example: Tailing to be treated, having passed a 40-mesh screen, assayed 1,500 kg. Ag per ton.

A charge of two tons of raw tailing is put into each 5-ft. pan, hence take double the quantity calculated below on one-ton lots. The figures under the formula represent molecular weights.

$$2NaCl + CuSO_4 = CuCl_2 + Na_2SO_4$$
$$117 + 159 = 134 + 142$$
$$CuCl_2 + Ag_2S = 2AgCl + CuS$$
$$134 + 247 = 286 + 95$$

Hence it is seen that it takes theoretically 1,591 parts of copper sulphate for every 216 parts of silver in the ore, to form the chloride of silver.

$$216 : 1{,}500 :: 1{,}591 : x$$

Hence use 1.1 kg. $CuSO_4$ per ton of ore as the minimum allowable for silver alone.

In a similar manner 1.1 kg. $CuSO_4$ will require 0.9 kg. salt. But the $CuSO_4$ is soluble and uses up the salt, and if there are other soluble compounds, such as sulphates, etc., especially in roasted ore, they may *one* or *all* require salt. I confess this is the weak point in deciding how much salt, and the minimum to be used can be determined only by experiment. So it is evident that any experiments of this kind are more valuable in the saving of chemicals rather than in improving extraction. It is safe to start by using an *excess* of 10 kg. salt per ton of ore, above that calculated for any copper sulphate added or formed in the roasted ore. The amount of soluble sulphates in an ore may be easily tested by the addition of barium chloride. If anyone believes he can ascertain what reaction is influencing his process, he should look for other solubles, bases, salts, etc., as they are easily found by the simplest tests.

Salt is apparently the least harmful chemical one could use in excess in his charge. It might, in great excess, dissolve AgCl, but the mercury would precipitate it and amalgamate it. $CuSO_4$ is about the worst thing added in excess, as it causes flouring, and if it does cause copper to enter the amalgam, it sickens it and makes it brittle, causing it to slime by friction in the charge. To see if there is a waste of $CuSO_4$ by the precipitation of copper in the amalgam, test a small piece by dissolving in strong nitric acid, and add an excess of ammonia. It should show a trace of copper. If it does not, it proves that there may be a lack of $CuSO_4$ for satisfying something more necessary. If it is believed that too much $CuSO_4$ has been added, it can be taken up by adding lime, the reaction being:

$$CaO + H_2O + CuSO_4 = CaSO_4 + Cu(OH)_2$$

This will prevent the copper from further entry into

the amalgam, for the lime will attack the $CuSO_4$ before attacking the chloride. It will stop flouring, if due to oil, and it will have a tendency to thicken the charge, and also to heat the charge if cold. In the isolated pans I always added it five minutes before discharging, because for some reason it seemed to cause a diminution of floured quicksilver. In the Boss process it could be added to the last of the series of pans and have the same effect. The quantity I added was enough to cause the charge to have the peculiar smell of a limy solution and to cause foam to appear on the surface of the solution of the settler, CO_2 being evolved. From the above equation it is seen that it takes 0.4 kg. CaO to neutralize the 1.1 kg. $CuSO_4$; hence a slight excess is needed. It is so cheap, and ordinary burned lime is so impure that an excess is likely to be added. (Roasted ores may be alkaline if they contained $CaCO_3$, as the result of roasting will produce some CaO.) The use of lime will frequently do away with chemicals such as KOH, NaOH, KCy, zinc amalgam, etc., used to clean the mercury. Flouring seems to be worse as the sulphides increase. At Los Grados only one-third of the sulphides are removed by a Frue vanner when everything is working well, and if the amount of sulphides in the ore remains the same and the vanner removes less, there is a perceptible increase of floured mercury, as found by testing with the horn spoon. Occasionally flouring will continue until discharging time, and it may sometimes be prevented by lowering the muller during the last few minutes. This seemed to work well when even the lime had but little effect. According to usage in pan work, no grinding is done after the salt and $CuSO_4$ are supposed to have had time enough to do all the chemical work preparatory to adding the mercury. Perhaps it can be explained by the evidence of the horn spoon; collect a little of the floured, or sickened mercury, by washing a portion of the pulp. It will not unite of its own accord, but press or rub it with your fingers, and it readily unites.

Too fast a motion of the muller will beat the drops of mercury into minute globules. If the speed is not sufficient, the charge will not buoy up particles throughout the charge. Too thin a pulp is just as bad for buoying up the particles of mercury. If the charge is too thick, flouring will result from friction. A happy mean of speed and thickness of pulp must be chosen, the speed varying from 65 to 85 rev. per min. A good amalgamator ascertains how thick his pulp is by trying how gritty it feels between his fingers, by the sound of the ripples produced, by taking a dip with the horn spoon and examining the amalgam or mercury, or even by sight.

Steam dilutes the charge from condensation. The settler has a continuous discharge in the Boss process, but in the case of isolated pans and in the presence of a little sand the settler must continue running for a while after receiving its tailing from the pans, and allow the fine particles of mercury and amalgam to settle. At Los Grados an 8-ft. settler is used for two 5-ft. pans. The settler has three discharge-holes at different heights from the bottom, the lowest one being 8 in. from the bottom. In discharging from the upper holes, no floured mercury, or at most, a trace, escapes, if at the time of discharging from the nearest hole below the surface of the solution, no grit is felt between the fingers, the arms making 14 rev. per min. When the lowest hole is discharged, some floured mercury is always found and such tailing must be caught. Heavy sand usually collects slowly in the bottom of the settler, largely on account of some of the battery screens having worn away unevenly. This sand also contains a large percentage of sulphides and is valuable.

What was said about the number of revolutions per minute for the pans, applies in principle to the settler, especially where everything has not been thoroughly slimed, and in using isolated pans. Even if a sandy tailing is to be treated, roasting helps to slime the tailing by causing the grains containing sulphides to break open and makes even the minute particles of sulphides become brittle and porous after oxidation. No matter how much water is used in the pans, the settler requires a great excess to allow all particles of mercury and amalgam to settle. Use as little water as possible in the pans, all other things being considered, because the less dilute the charge, the more concentrated it is chemically; the steam to heat it will be less, and it may be found that the time of treatment will be shortened.

A good concentration is advisable before amalgamation because not only do sulphides cause a loss by flouring the mercury, but because a nasty matte will often be formed on the top of the melt in refining. As the concentration at Los Grados is poor, most of the matte is caused by sulphides being ground into the hard lumps of amalgam found in the pan and settler-bottoms (roasting has solved the problem to some extent, but there are times when there is a scarcity of roastermen and *peones* to cut cord-wood). The matte here runs one-fifth of the value of the bullion itself and the resulting bars have a dirty coating in spite of careful refining (the coating being matte and not slag).

The use of plenty of mercury in pans and settlers helps to dilute these hard lumps, aiding impurities to rise to the surface so that they are swept away. An excess of mercury is also as necessary as an excess of reducible litharge in a crucible assay, as it causes more particles of mercury to come into contact with unsettled and minute pieces of amalgam. If a settler is provided with a mercury trap not plugged on the inside, and too little mercury is kept in the settler, sand will appear with the mercury when strained, appearing just as matte or speiss appears in the siphon of a blast-furnace lead-well, if too much lead is removed. In a small remote mill the supply of mercury may at times get so low that we must begrudge a sufficient supply in the settler to allow it to have an automatic discharge of mercury to the strainer. This has happened at Los Grados, so we put an inside plug in the settler and, a little after discharging a pan into the settler, the plug is opened enough to allow mercury to trickle into the trap and be used over immediately in the pans. The evil of this necessity is that the inclined groove and outlet of the settler are soon clogged with hard amalgam, and scarcity of mercury requires an early clean-up and retorting. Another reason for using an excess of mercury is that stiff amalgam contains about five times the amount of mercury that it has gold, silver, and various alloys; therefore, use say twenty times the quantity of mercury as the bullion to be obtained.

In some remote parts of Mexico the price of salt is over 150 *pesos* per ton, and mercury is 80 *pesos* per flask, so that the process becomes almost prohibitive. This is so when roasting with salt. We found at Los Grados that 10% salt in a roast gave excellent results and that it was not worth while to roast (if salt were used) with less than 5%. This is probably why at Pachuca (although on the railroad) they prefer to treat the ore raw, using even much less than 3% salt at times, and avoid the expense of roasting and the volatilization resulting therefrom, which might be 5%, even if carefully but thoroughly done.

Extraction varies greatly from apparently insignificant causes, one of them being the very fine particles of iron from shoes, dies, and mullers. At Pachuca the manager of El Progreso, a 50-stamp mill supplied with re-grinding machinery, and the Boss continuous process,

informed me that he had made a test lasting for three days to see what effect this iron had on the extraction. An electro-magnet was placed in the tailing-launder of the concentrator and the iron collected. It was found that the presence of this iron resulted in an increased extraction of 7%. Iron is a precipitant for copper, and this is brought down when the iron is added from outside with an idea that AgCl may be forming, to precipitate the silver. In the Bartolomé de Medina mill at Pachuca they find it necessary to clean their amalgam by placing it in a rotary barrel and treating it chemically to remove copper, as the ordinary amalgam produces extremely low-grade bullion. *Their* explanation of the treatment given in the barrel is: $CuCl_2 + AgCuHg = AgHg + 2CuCl$. In that *hacienda* they used 3% NaCl and 0.4% $CuSO_4$. This looks as if they were using too much $CuSO_4$ for 800 gm. Ag per ton of ore, unless there is something else consuming the copper sulphate.

Extraction by pan-amalgamation seldom exceeds 85% (using the combination process). A well-known manufacturer of mining and milling machinery says in his catalogue describing the modern 40-stamp combination mill of the Eureka Hill Mining Co., erected by him: "There are few mills working raw ore of this class which exceed the saving made, 85%, and it is likely that if they do, they are getting dollars that cost $1.50."

A good idea of costs may be obtained by citing the practice at Pachuca, one of the oldest camps in Mexico. The Spaniards did so much work there that they left a supply of gigantic retorts, which are still being used by large companies (a great number may be seen used as posts about the street corners to protect houses from damage by ore teams; many people suppose them to be Spanish cannons). Here pan-amalgamation, the outgrowth of the *patio* and *arrastre* processes, is as well understood after years of patient and costly experimenting, as anywhere. The several large mills, all using the Boss process, are competitive buyers of ore unusually clean and adapted to the process (all the Pachuca mills are operated by electric power). The ores are highly quartzose, showing a little lime and traces of galena, the best part of the ore being the pyrite concentrated by Standard and Johnston tables. The concentrate is sold to the numerous ore-buyers and shipped by them to the smelters, none being roasted for amalgamation (haulage to the three railroad depots is but a small expense). In general, the mills pay for 70% of the silver and none of the gold. There is a treatment charge of 13 *pesos* per ton, although it actually costs 10 *pesos*. The ores generally being docile require a minimum amount of chemicals; the labor is cheap, being almost exclusively native. The ore is all treated raw, either by stamps, as in the Progreso, or by Chilean mills, as in the Bartolomé de Medina. No plates are used before the concentrators. The ore generally treated contains about 800 gm. silver per ton; it is thoroughly slimed; no grinding in the pans is necessary, therefore, and it simplifies and cheapens the process. The losses in mercury are chiefly from flouring. I was informed that there was a loss of 850 gm. mechanically, for every ton of ore treated, and a loss of 184 gm. chemically, for every kilogram of bullion. In the Progreso mill, the pulp receives six hours of total treatment from the time it leaves the stamps until it leaves the settler. The temperature of the pan-charges is from 50 to 60° C. In the Bartolomé de Medina, using more chemicals, it is from 5 to 10° lower, the aim being to get 45° C., equal to 113° Fahrenheit.

A thorough clean-up is made once every three months in these Pachuca mills. There is but little difference in the grade and quality of the ores amalgamated there. An extraction of 85% is rarely reached. Mercury is fed to only the first of the series of pans, being thrown in by the dipper-full, no precaution being taken to strain it into the charge. It has to be strained anyway to collect the amalgam before being returned. Most of the mercury therefore sinks directly to the bottom and must be picked up by the pulp and scattered through it.

A unit consists of from 5 to 8 pans in a line. All but the first of the series receive most of their mercury by the settling that follows the overflowing of the pulp from the previous pan. The passage between the pans must frequently be kept clear by urging the pulp along by poking it, otherwise it is likely to be too watery. The mercury from all pans but the first, is interchanged with the strained mercury but once or twice a day. A series of more than eight pans is as useless as are too many zinc-boxes in the cyanide process, all the extraction being practically in the first ones. Where the Chilean mills are used to crush the ore, sliming it in one operation, the pulp is run out into masonry vats and overflows into large yards formerly used for the *patio* process. The excess of water is thus easily removed and the pulp is thrown into pan No. 1 and just sufficient water added continuously to give the right consistency. The Progreso mill crushes, by stamps, through a 20-mesh screen and so little wash-water is used that the pulp scarcely flows after passing the mortar-screens. Kinkead mills complete the sliming. About 40% of the slime passing the 20-mesh screen, will pass an 80-mesh screen. In this mill there is no handling of the pulp a second time, as it arrives automatically at the pans with the right consistence for amalgamation.

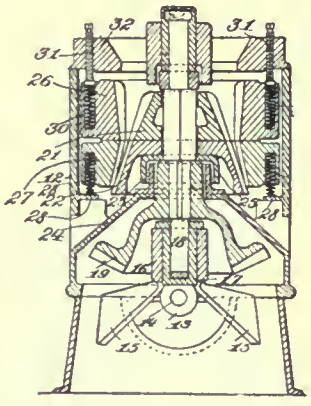
The Progreso is the pride of the pan-amalgamation mills in Pachuca. By able management it has been developed from a mill running not over two hours steadily and with Irish dividends, to a mill working with a high extraction, running every hour of the day, and paying such high dividends that with a part of them the company is erecting an immense cyanide plant to treat Pachuca ores. The Real del Monte Co. is erecting a large cyanide plant, and Pachuca will soon receive a boom. Pan amalgamation is making room for cyanidation, a process better understood now for handling slime and the extraction of silver than formerly. The slime from the Pachuca mills, *patios* and *arrastres*, for the last fifty years, has been caught in the wide valley below the town. Several estimates by different parties show over 500,000 tons that will before long be treated by the cyanide process, as the treatment for them has been successfully solved.

I believe that there are many ores used in the amalgamation process that could be made to yield to the cyanide process and that if the former process is not improved before long it will be in disfavor. A number of people who understand pan amalgamation and have made money by it, say that with all their experimenting and knowledge of chemistry, the proce-s is one the results of which may hinge on any one of the numerous and complicated phenomenal reactions within the pans. They believe, however, that there is some sort of electrolytic action going on, influencing or retarding the extraction and that is quite reasonable, since copper sulphate is an electrolyte. I have never heard of any experiments being attempted to use the muller-ring and pan-bottom as electrodes during some part of the operation. It is certain that the iron would become magnetized and might or might not be more of a blessing than an evil. It would be interesting to learn the experience of others. There is room for more improvement.

MINING AND METALLURGICAL PATENTS.

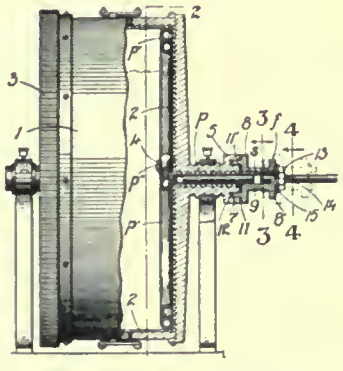
Specially Reported for the MINING AND SCIENTIFIC PRESS.

VERTICAL CRUSHING AND GRINDING MILL.—No. 856,311; Thomas L. Sturtevant, Quincy, and Thomas J. Sturtevant, Wellesley, Mass., assignors to Sturtevant Mill Company, Portland, Me., a Corporation of Maine.



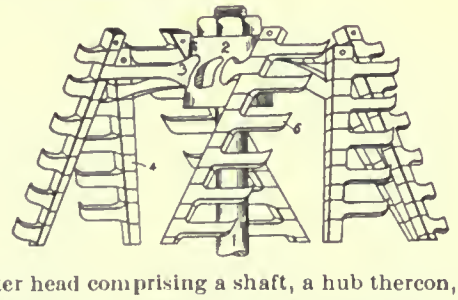
In a crushing machine, the combination with a casing having an open top, of a vertical shaft and rotary crushing elements carried thereby, non-rotating or normally stationary crushing elements elastically supported by said casing for vertical movement relative thereto, said latter elements presenting an interior surface which converges downwardly for a portion of its length and diverges downwardly for another portion of its length, said normally stationary crushing elements being adapted to be inserted or removed through the open top of said casing, and a removable cap for said open top.

CHLORINATION BARREL.—No. 856,384; William J. Armbruster, St. Louis, Missouri.



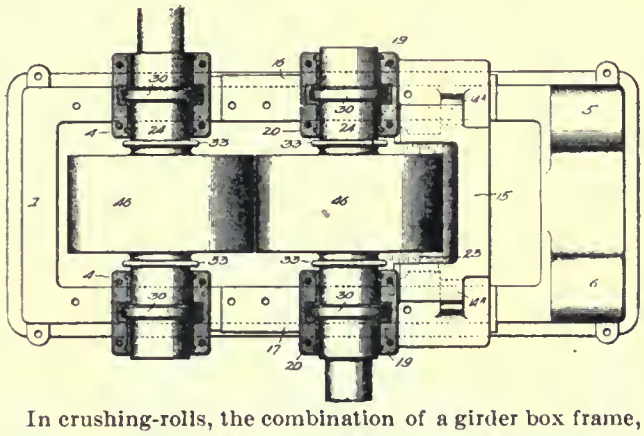
A chlorination barrel having a pulp chamber, a delivery pipe carried by, and rotatable with the barrel, and discharging thereinto, a section of the pipe being above the level of the pulp in the pulp chamber during the rotation of the barrel, and a feed-pipe discharging into the outer end of the delivery pipe.

DREDGER-CUTTER.—No. 856,487; John F. Ollrich, San Francisco, California.



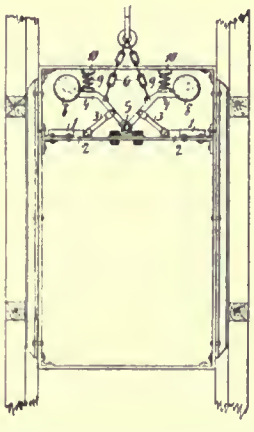
A cutter head comprising a shaft, a hub thereon, arms or spokes radiating from said hub, bars extending from the ends of said arms or spokes in planes oblique to that through the shaft, and cutting device having parts formed integral therewith and resting over and in contact with opposite sides of the bar to protect the same from wear.

CRUSHING-ROLLS FOR ORE, ROCK, AND OTHER MATERIAL.—No. 856,559; Thomas C. Walker, Jr., Denver, Colorado.



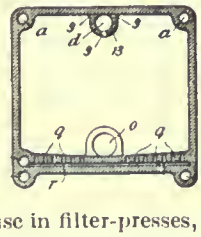
In crushing-rolls, the combination of a girder box frame, having a guideway, a fixed roll, a saddle slidably mounted in said frame and guideway, an adjustable resilient buffer device for said saddle, and a roll mounted in said saddle in crushing relation to said fixed roll, with shafts forming a part of said rolls and provided with journal collars, journal boxes adapted to support said shafts, recesses in said boxes adapted to receive the journal collars of said shafts, and a lining of Babbitt metal in said boxes and recesses around said shafts and their journal collars.

MINERS' CAGE.—No. 856,276; Wilhelm Massing, Borbeck, Germany.



A device for automatically and instantly arresting miners' cages upon the breaking of the hoisting rope, comprising in combination with the cage, the hoisting rope, and the track ledges for said cage; shells (1) provided on the top plate of said cage at both sides of the latter facing said track ledges, arresting catches or bars (2) movably mounted in said shells and provided with upwardly directed sharp-pointed outer ends, links (3) pivoted with one end to the inner ends of said catches (2), a bearing (5) fixed on the top plate of said cage, levers on said frame member (10), said levers (4) and adapted together with said weights (8) to press, upon the breaking of said hoisting rope, said levers (4) downward and consequently said arresting catches (2) outward into said track ledges.

CONTAINER FOR PRESSURE-FILTERS.—No. 856,596; Charles W. Merrill, Lead, South Dakota.



A container for use in filter-presses, provided with a passage having openings therefrom into its interior, whereby a suitable cleansing medium is so projected as to flush the entire interior of the container, and a suitable opening through which the unfilterable component is washed out.

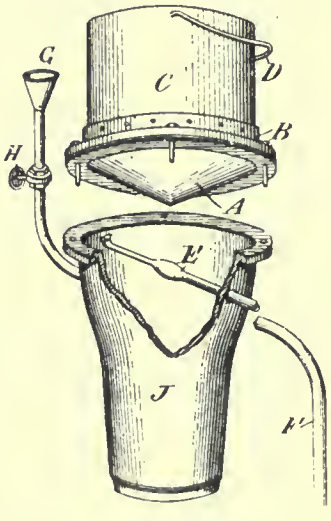
Gasoline Locomotive.

A gasoline locomotive sufficiently small and compact to be used for mine-haulage has been perfected by Fairbanks, Morse & Co., Chicago, Ill. The machine illustrated was designed to suit the reqirements of contractors, industrial plants, etc., but the increasing demand for a machine that would handle coal and ore cheaper than rope-haulage or an electric system led them to modify this type to meet the exacting conditions of mine-haulage. It is designed to operate on either gasoline or denatured alcohol. The mine-

owner will appreciate this, especially if his mine is one of the 'gassy' variety, as alcohol gives absolutely no odor. If no trouble is experienced from gases, gasoline may be used and very little, if any, odor is noticeable. We are informed that they make two sizes, one having a capacity of 10 tons and adapted for gathering purposes, and the other with a capacity of from 20 to 25 tons for main-entry haulage. The gathering locomotive will meet with great favor, as mules are getting to be high-priced and scarce. One of these gathering machines will handle 50% more coal than a mule, and the cost of feed will offset the fuel bill. A descriptive catalogue will be sent on request.

The Lackmann Mercury Still.

Raymond A. Lackmann, inventor of an improved mercury still, furnishes us with the following data concerning the device: The invention relates to improvements for the



rapid distillation and purification of mercury. The distillation is accomplished by using low steady heat. The mercury vapor collects on a conical copper plate, silver plated on the lower side, which forms the cover to the retort; the condensed mercury drops from the point of the cone into an iron spoon, and is conducted away by a small iron or steel spout. Above the cone-shaped plate is a receptacle for holding water, if necessary as a protection for the silver plating, to prevent its expansion and contraction as against the copper, which might result in its peeling. The iron spout dips into a vessel containing water. By means of a funnel, spout, and valve, more mercury can be admitted, and the operation may be made continuous. The still is heated in a small charcoal-burning furnace, which is not patented, and is easily made.

The Weston Multimeter.

The accompanying cut shows the Weston multimeter, manufactured by the Weston Electrical Instrument Co., of Waverly Park, Newark, New Jersey. This is a new form of electrical measuring instrument, which possesses a

wide range of usefulness in the measurement of electrical quantities, the one instrument serving the purposes of a direct-current voltmeter, milli-voltmeter, ammeter, mil-ammeter, ohmmeter, ground detector, and wheatstone bridge. Although the scope of measurements that can be made by this instrument is large, a much higher degree of accuracy is obtainable with it than with any so-called 'universal instrument' known. The device is fully described in Bulletin No. 6 of the company.

Catalogues Received.

THE BLAISDELL COMPANY, of Los Angeles, has issued Catalogue G, on the Blaisdell Pressure Filter.

THE C. W. HUNT CO., of New York, has issued Catalogue No. 072, on Hunt Coal Handling Machinery.

THE LIDGERWOOD MFG. CO., of New York, sends us a catalogue of Lidgerwood Electric Hoisting Engines.

THE BARRIETT ELECTRIC MFG. CO., of Cincinnati, Ohio, is sending out Bulletin 5, on direct-current motors and generators.

THE ALLIS-CHALMERS CO. of Milwaukee, Wis., issues Bulletin No. 1513, dealing with the Christensen portable air-compressor.

THE CRANDALL PACKING CO., of Palmyra, New York, sends us an attractive catalogue and price list of improved steam, ammonia, and hydraulic packings. The publication contains a table showing what styles of packing to use for various purposes and pressures.

Commercial Paragraphs.

DE GOLIA & ATKINS have moved to 1020 Crocker Bdg., from the Kohl Bdg., San Francisco.

THE demand for crushed stone for many purposes, but more especially for concrete construction, is becoming greater with each year, as evidenced by the many large crushing plants now in process of construction. A noteworthy feature in connection with these new plants is the size of the crushers installed, the demand being for machines of extremely large capacity, as for instance, the No. 10 McCully, the capacity of which is from 300 to 700 tons of crushed stone per hour. This size of crusher was first placed on the market a little over a year ago, by the POWER & MINING MACHINERY CO., of Milwaukee, and its popularity was so pronounced that there have been something like 20 or 25 of these machines sold to date.
